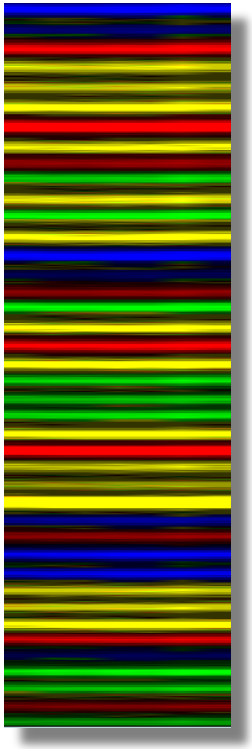
„Genomforschung und Sequenzanalyse

- Einführung in Methoden der Bioinformatik- “

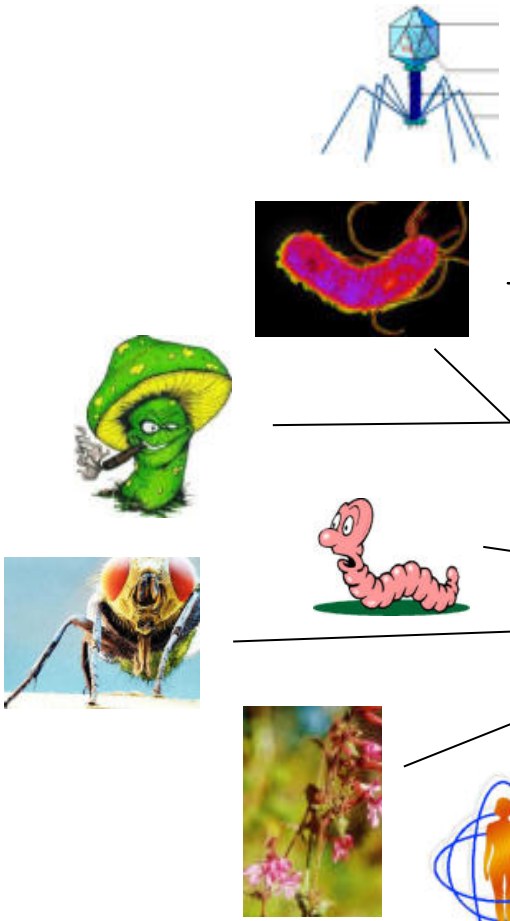
Thomas Hankeln



Methodik der Genomsequenzierung

NGS-Technologie

Meilensteine



Phi X 174	1977	5.386 bp
λ– Phage	1982	48.502 bp
M. genitalium	1995	580.000 bp
H. influenzae	1995	1.830.000 bp
M. jannaschii	1996	1.660.000 bp
S. cerevisae	1997	12.500.000 bp
E. coli	1997	4.654.000 bp
C. elegans	1998	97.000.000 bp
D. melanog.	1999	116.000.000 bp
A. thaliana	2000	115.000.000 bp
H. sapiens	2001	2.693.000.000 bp

2012 > 1000genomes project (human)

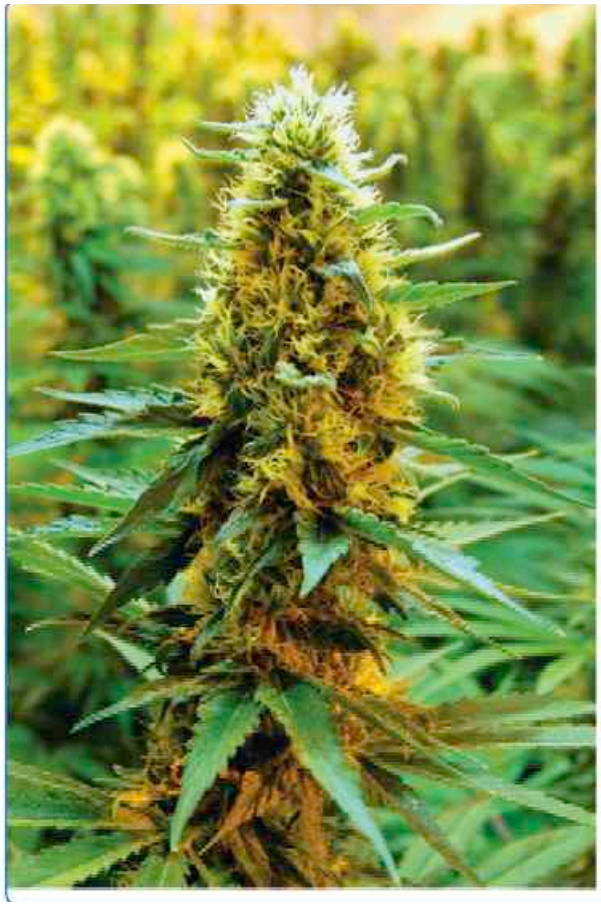
soon > Genome 10K (vertebrates)

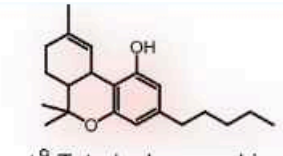
05.11.13 | **Erbgutanalyse**

Liegt das Talent für Mathematik in den Genen?

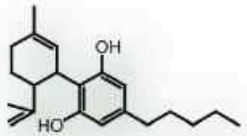
Ist ein Talent für Mathematik angeboren oder liegt es an der Erziehung? Ein US-Unternehmer will die Frage nun klären: Beim "Projekt Einstein" wird das Erbgut von 400 Mathematik-Genies analysiert. *Von Norbert Lossau*

How hemp got high: Cannabis genome sequenced

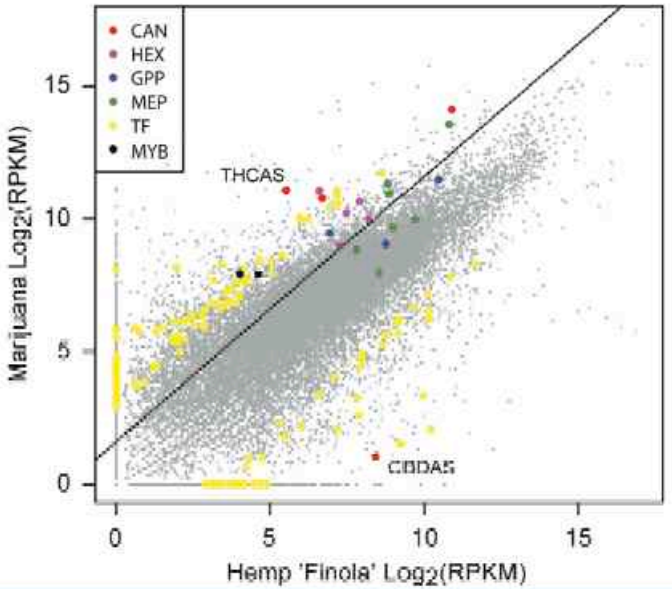




Δ^9-Tetrahydrocannabinol



Cannabidiol



van Bakel et al., Genome Biology 2011

Celebrity genomics

Science confirms the Neanderthal in Ozzy Osbourne

Among the findings that will presented Friday: Osbourne's genes reveal a probability of alcohol dependency "six times higher than the average person."

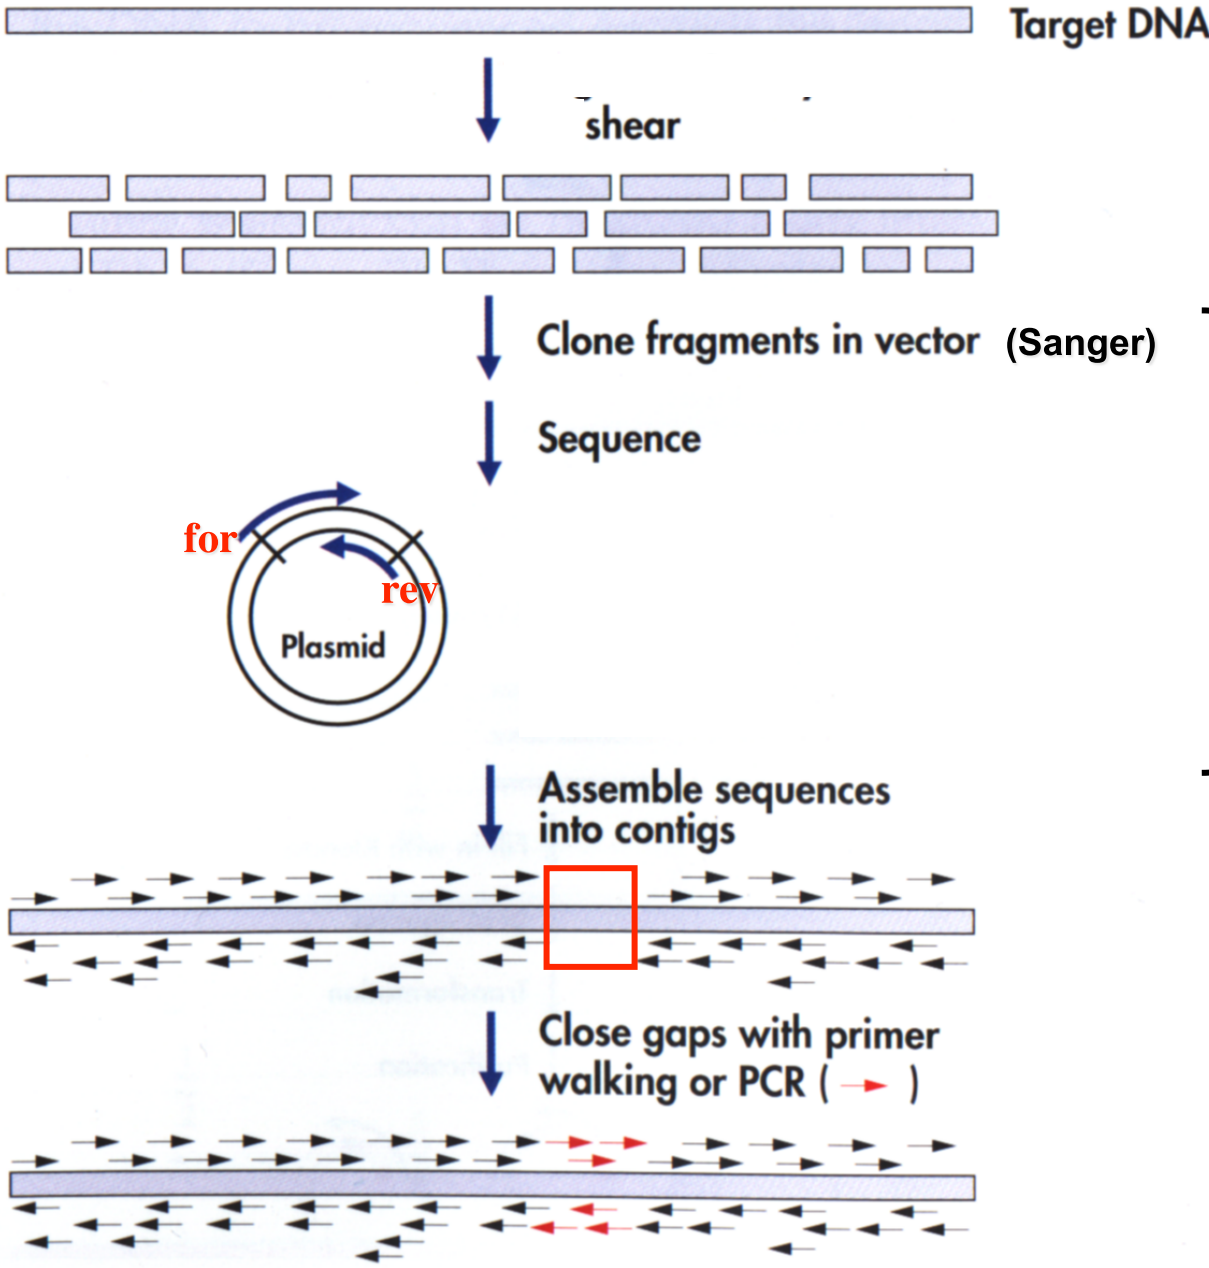
"All this is big news for blokes everywhere, I think: If the Neanderthals could get laid, there's hope for us all."

Methodik der Genomsequenzierung

- zu sequenzierende DNA muss zunächst in „handliche“ Abschnitte zerlegt und dann vermehrt werden (beim Sanger-Verfahren durch Klonierung oder bei Next-Generation Sequencing (NGS) meist durch PCR)

- DNA kann mit dem klassischen Sanger-Verfahren in Teilabschnitten von 600-1000 Bp („long reads“) sequenziert werden.

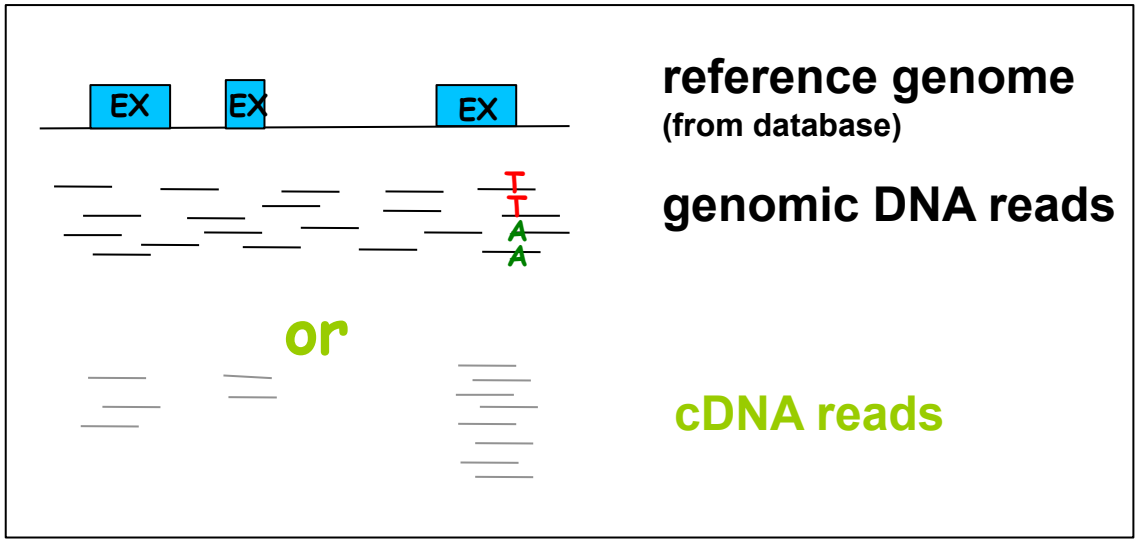
- NGS-Verfahren lesen derzeit meist kurz (z.B. 50 bis 250 Bp; = short reads“), aber auch mittlerweile sehr lang (> 5000 Bp; long reads)



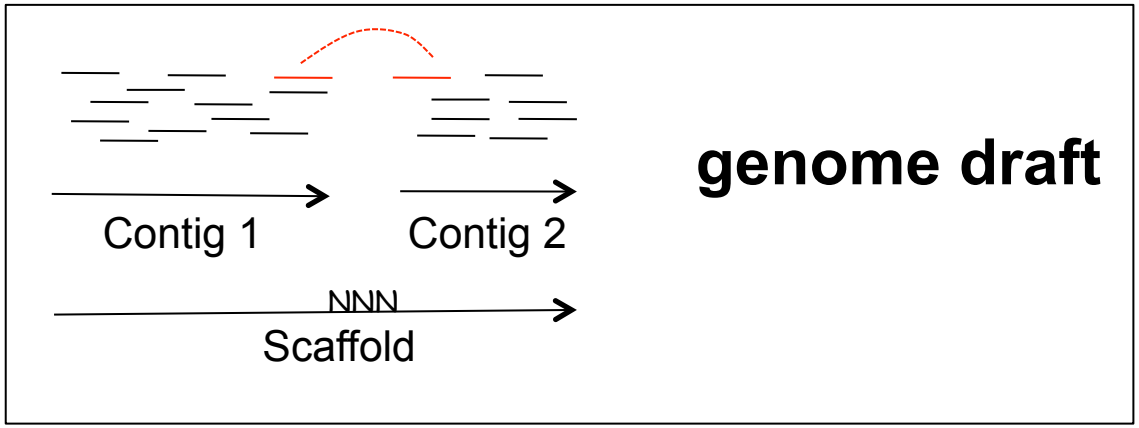
no cloning, but PCR and sequencing in NGS

Shotgun-Strategie

Genome sequencing:
Re- or *de novo*



- variant detection
- differential gene expression (RNA-Seq)

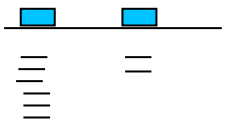


- de novo genome
- gene discovery
- genome evolution

Re- vs. de novo-sequencing

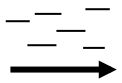
...require different bioinformatics algorithms

- Re-Seq



> short reads ok
> very high redundancy (SNP detection!)
> no assembly, but **alignment to existing reference sequence (*„Mapping“*)**
> possible on normal PCs (64bit, quadcore, 16 GB RAM)

- de novo



> longer reads better (due to repeats)
> classic **assembly** (OLC, de Bruijn graph)
> extremely RAM intensive (HPC, 512 GB RAM)

Martin JA, Wang Z, Nature Reviews Genetics 2011

NGS-Bioinformatik

Applikationen von Re-Sequencing

- Wo ist unser Genom variabel? Wo sind Mutationen?
  > Gesamtgenom-Resequenzierung

- Wo sind unsere Exons variabel? Mutationen?
  > Exome-Seq

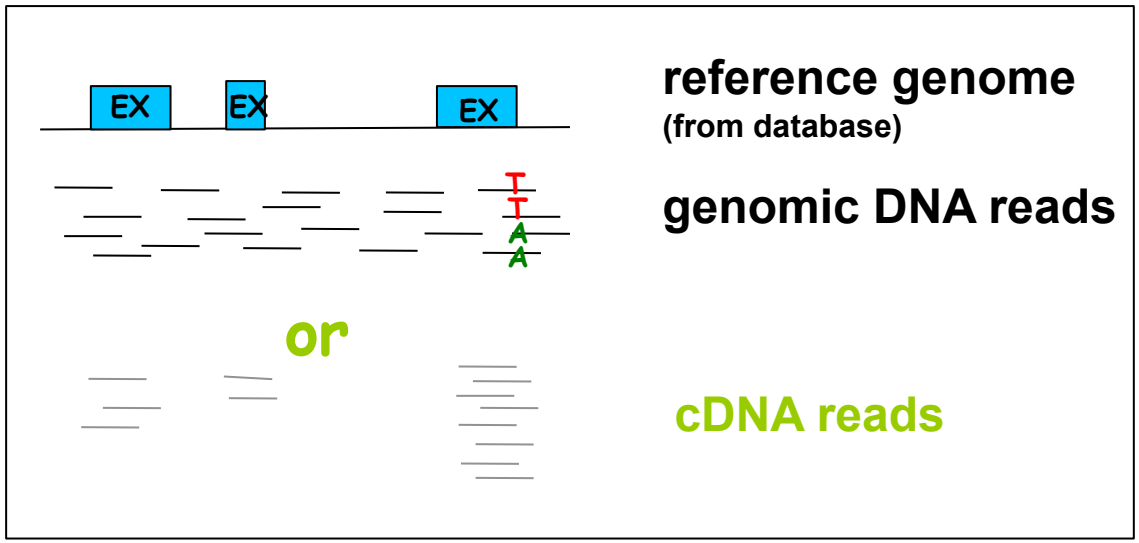
- Welche Gene werden transkribiert? Wie stark?
  > RNA-Seq

- Welchen Chromatin-Status hat das Genom?
  > ChIP-Seq (u.a.)

- Welchen Methylierungsstatus hat das Genom?
  > Methyl-Seq, Bisulfite-Seq (u.a.)

...entdecke die Möglichkeiten!

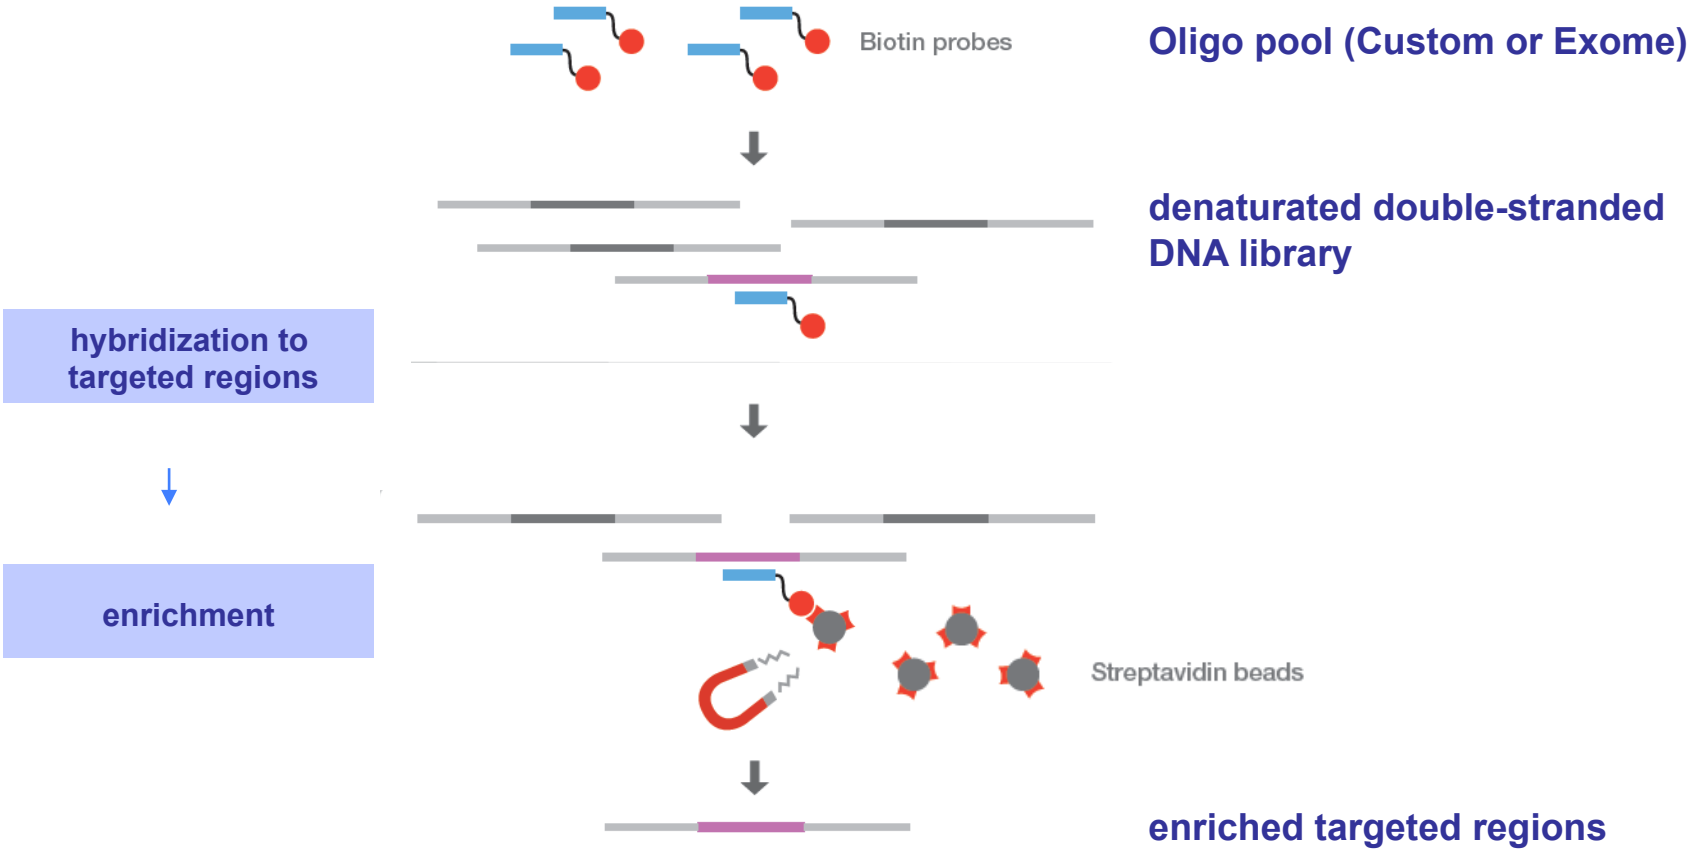
Gemeinsames Prinzip bei Re-Sequencing



Wichtigster Schritt: Zuordnung der Reads zu den passenden Regionen im Genom („Mapping“)

Exome-Seq

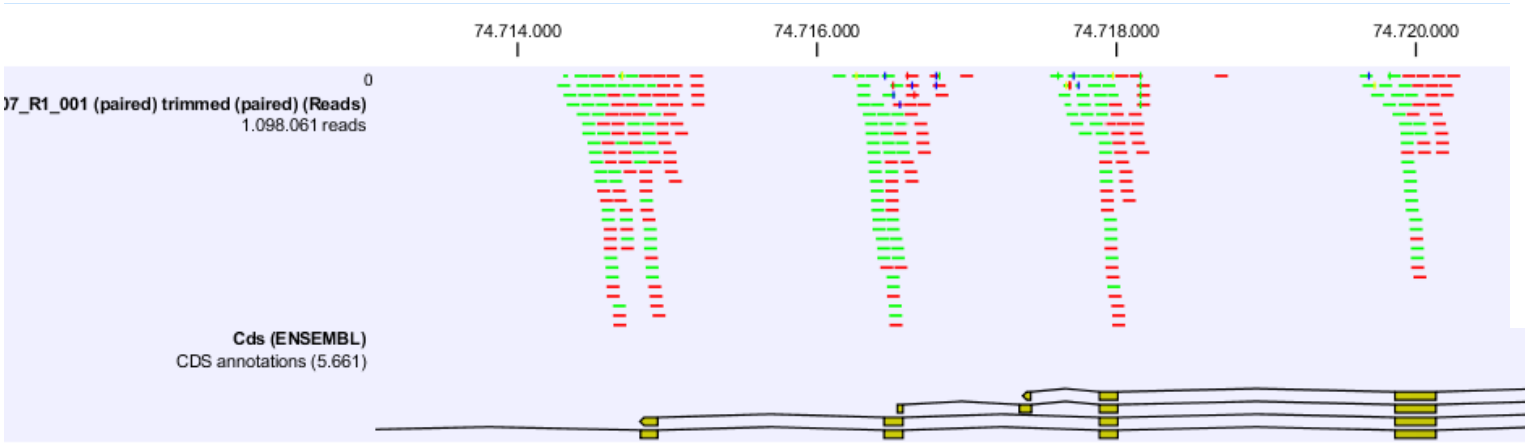
- **requires *a priori* knowledge of target to be sequenced** (e.g. exons)
- **target enrichment by hybridization**



Exome-Seq

Exome Enrichment:

Target region size	62 Mb
Number of target genes	20,794
Number of target exons	201,121
Number of probes	340,427



Exome-Seq

Ergebnis der Exome-Seq ist eine Liste von Nt-Veränderungen, durch die sich das sequenzierte Exom von einem Referenzgenom unterscheidet.

SNVs : single nucleotide variants

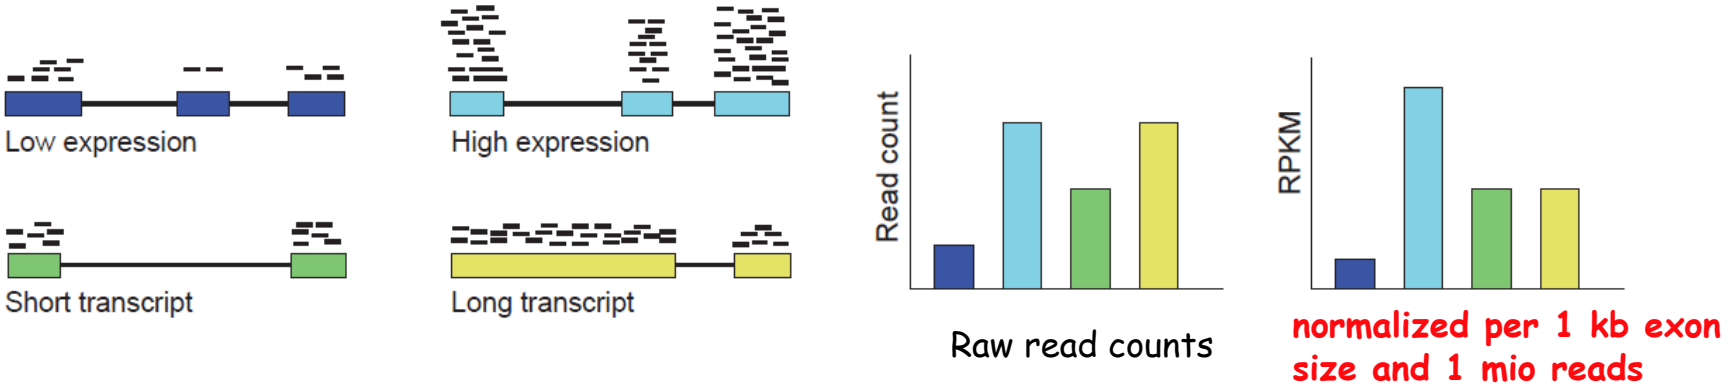
SNPs : single nucleotide polymorphisms*

cSNPs : coding SNPs

* mind. zu 1% als Allel in Human-Population vorhanden

Transcriptome analysis (RNA-Seq)

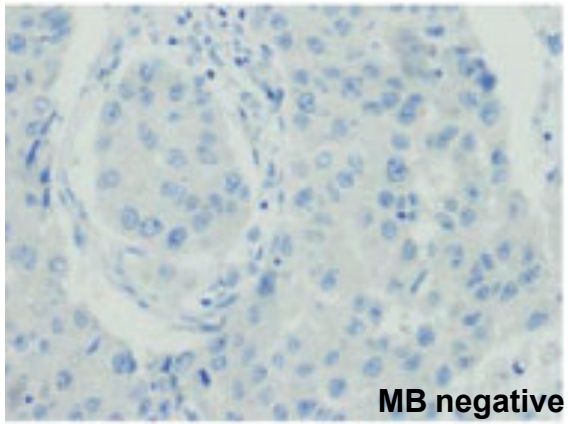
- **RNA isolation > cDNA production & fragmentation**
- **high-throughput sequencing**
- **mapping of fragments to reference genome**
- **read-counting as measure of gene transcription**

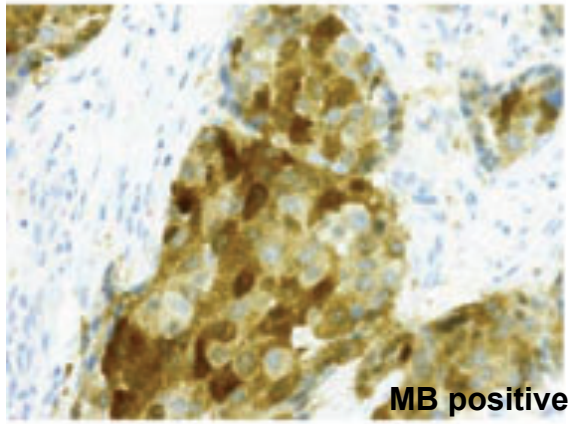


A typical measure is “RPKM“
= reads per Kb of exon sequence and 1 mio reads in the dataset

Beispiel: Was macht Myoglobin in Brustkrebs-Zellen?

MB immunostaining on breast tumors





RNA-Seq

Differenziell exprimierte Gene
= Hinweis auf molekulare Veränderungen

Gorr et al, 2011

Transcriptome analysis (RNA-Seq)

Ergebnis der RNA-Seq ist eine Liste von Genen, die zwischen den betrachteten Datensätzen statistisch signifikant differenziell reguliert sind.

Manchmal enthalten diese Listen Hunderte oder Tausende von Genen.

Dies macht es erforderlich, die Gene funktionell zu kategorisieren (GeneOntology-Vokabular, KEGG Pathways).

Sind bestimmte funktionelle Kategorien in den differenziell regulierten Genen über- oder unterrepräsentiert?
Was sagt das über die „Biologie“ der vergleichenen Proben?

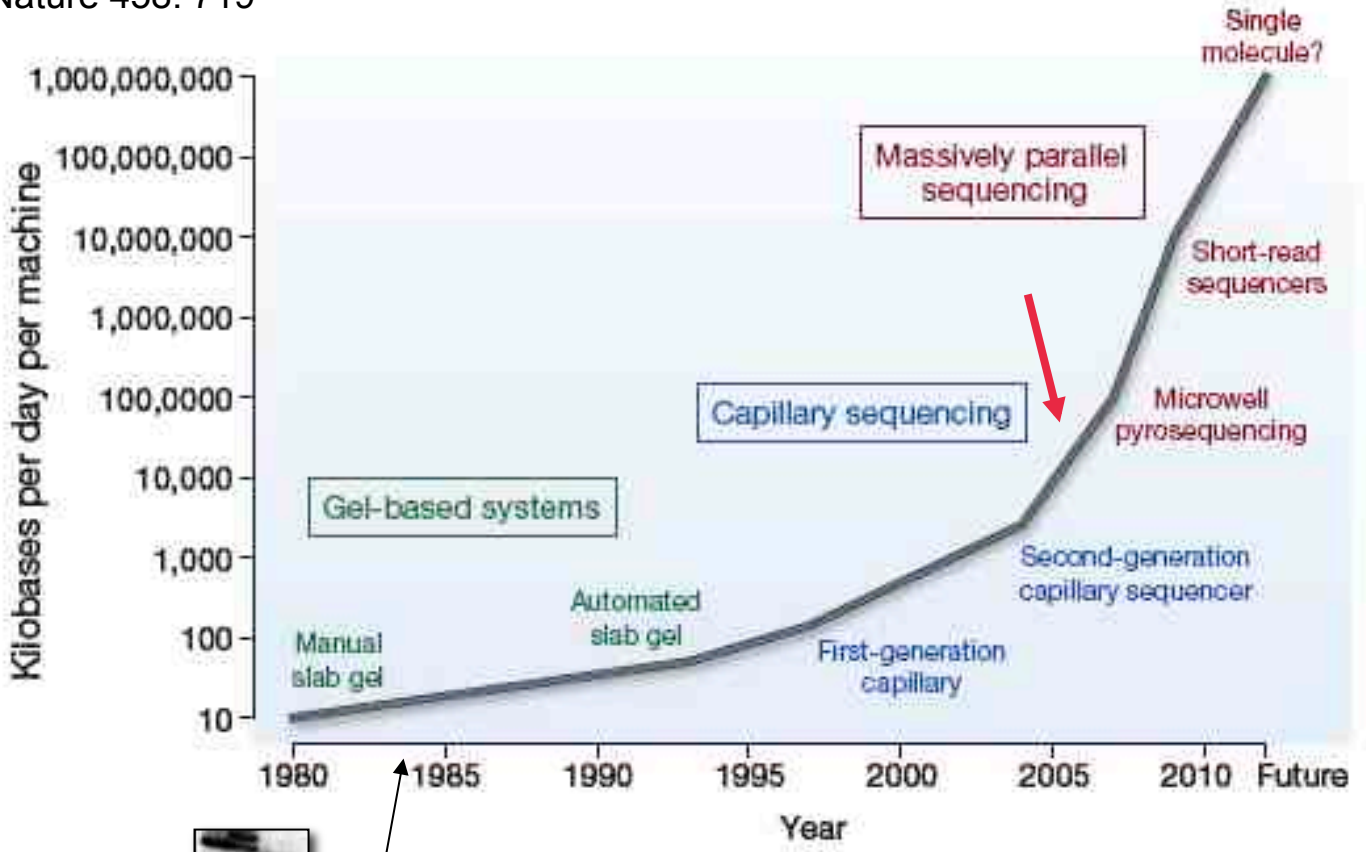
Trio-Analyse: Identifizierung von Krankheitsgenen durch Exome-Seq von Familien (Tag 1 & 2)

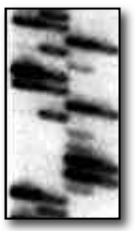
Transkriptomanalyse: Der Einfluss der Myoglobinexpression auf das Gesamt-Transkriptom von Krebszellen (RNA-Seq; Tag 3 & 4)

Q: Wie funktioniert NGS technisch?

Sequencing technology:
A million-fold improvement!

Nature 458: 719





my diploma thesis: 1kb Maxam-Gilbert, 4 weeks (day & night in the isotope lab)

NGS technology: How to...

tedious cloning
high chemical costs
slow electrophoresis

PCR or even single molecules
extreme miniaturisation
massively-parallel read-out

Illumina Sequencing - principle

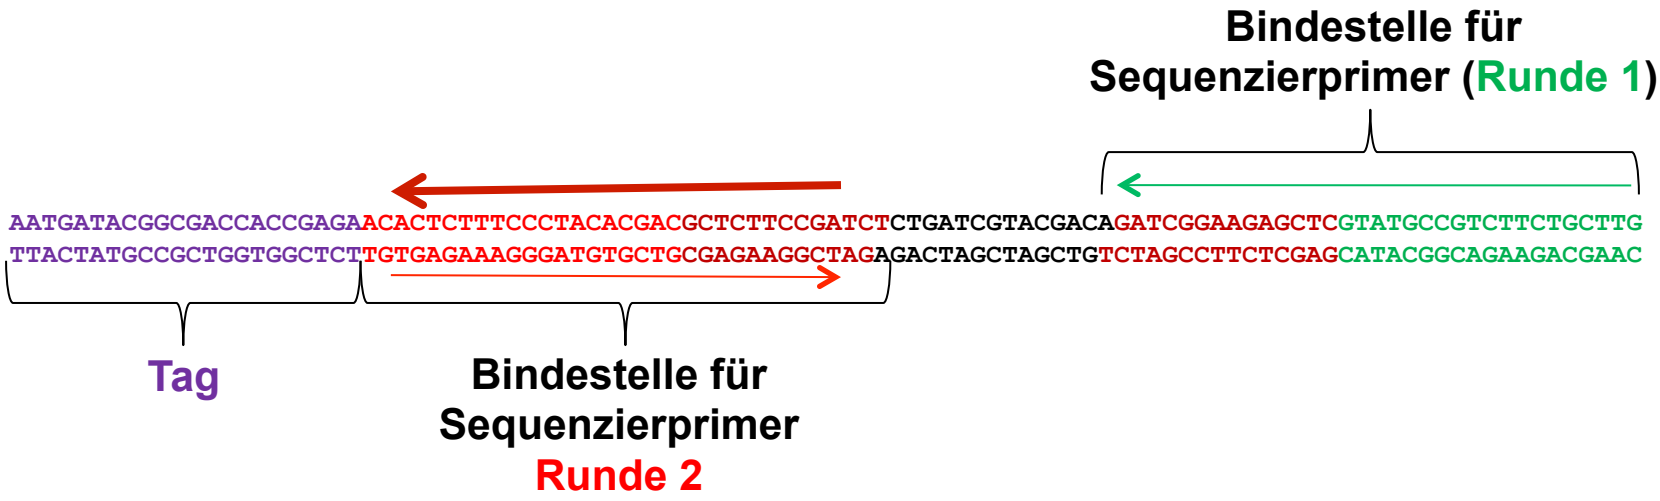
durch PCR angehängt
(enthält Multiplex-Tag)

von Y-Adapter

Sequenz, die in beiden Adaptern identisch ist

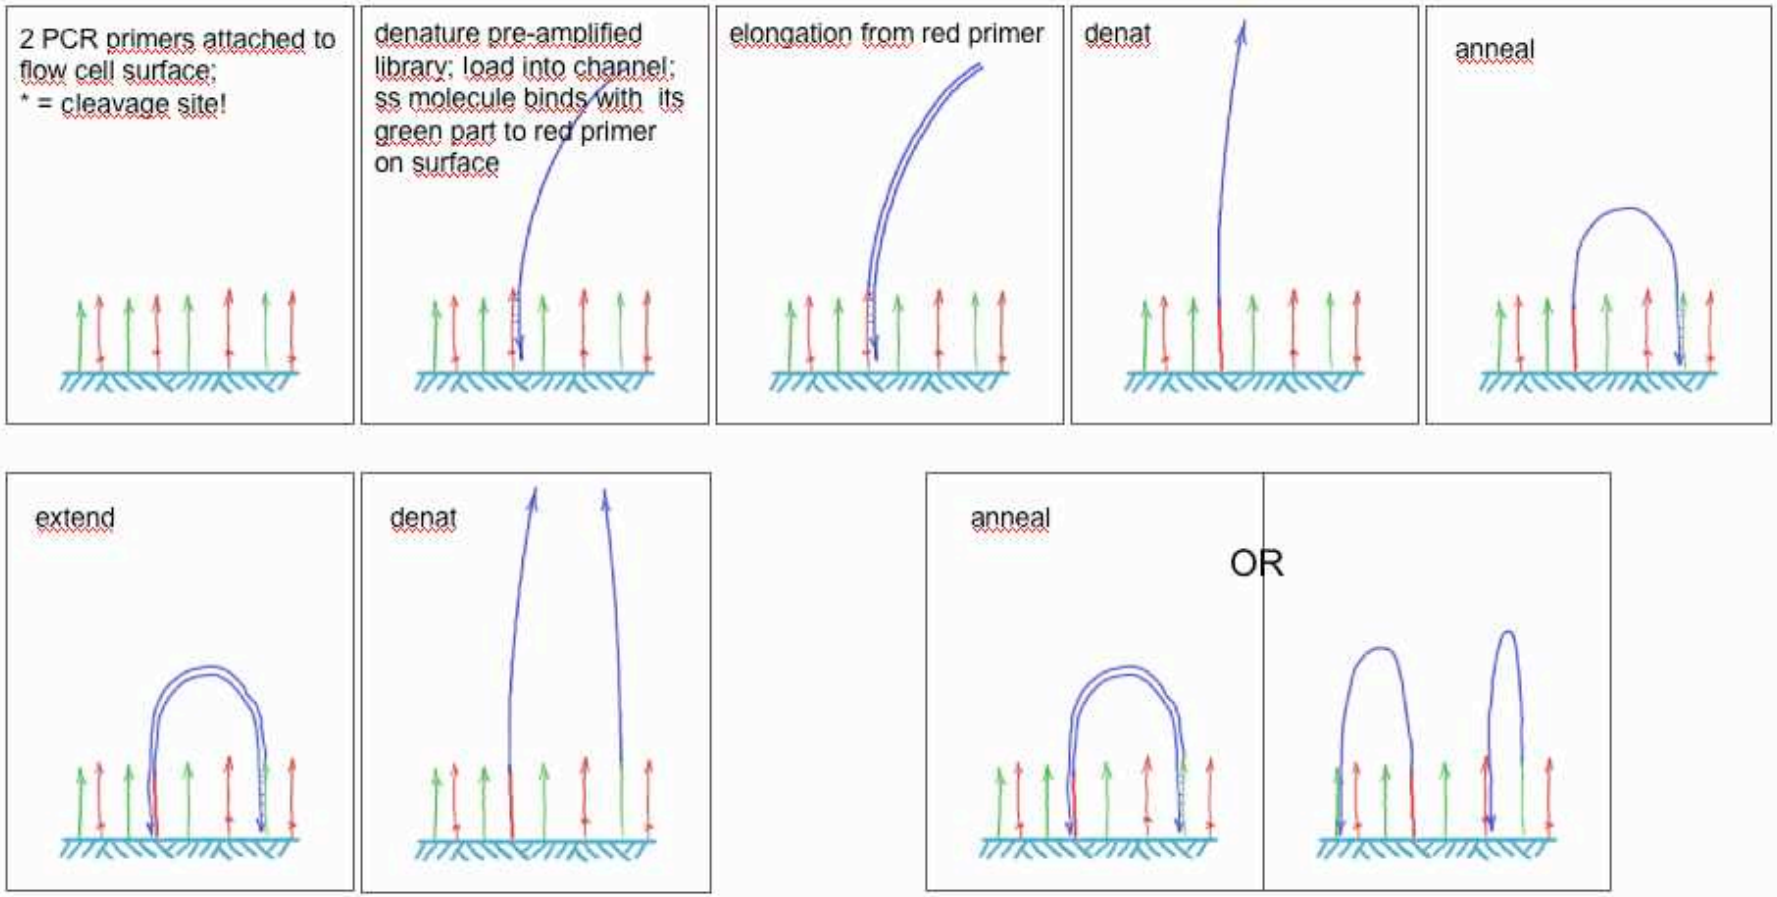
Illumina Library-Preparation



- Multiplex-Tag ist also nicht in den Sequenzen enthalten, die von den Primern der Runde 1 und 2 ausgehen
- Für Tags gibt es daher einen separaten kleinen Sequenzierlauf ausgehend vom Primer DUNKELROT
- die Sequenzierungen von Primer 1 und Primer 2 aus nennt man PAIRED-ENDS!

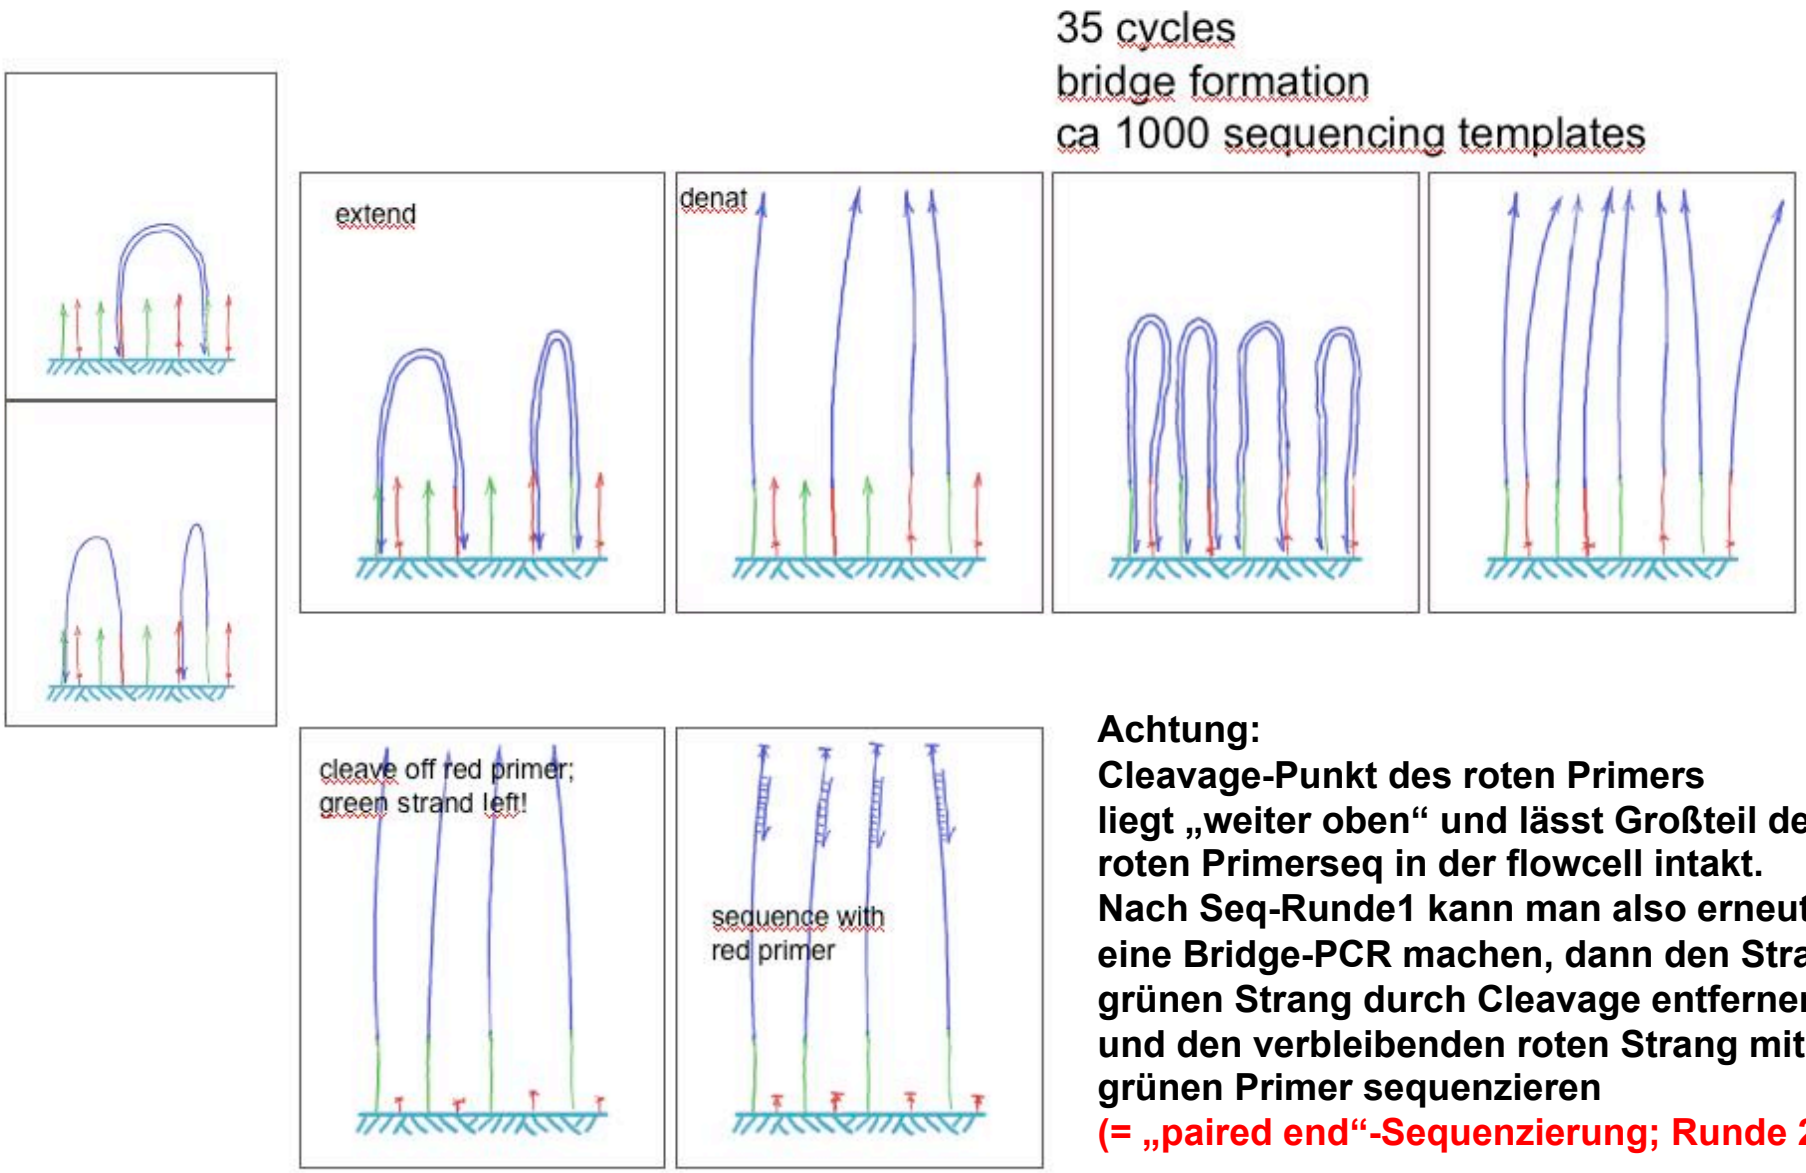
Illumina template prep: bridge PCR

Shear DNA > size fractionate > attach adapters > pre-amplify by PCR with red and green primers > then: bridge PCR on flowcell



p://seq.molbiol.ru/sch_clon_ampl.html

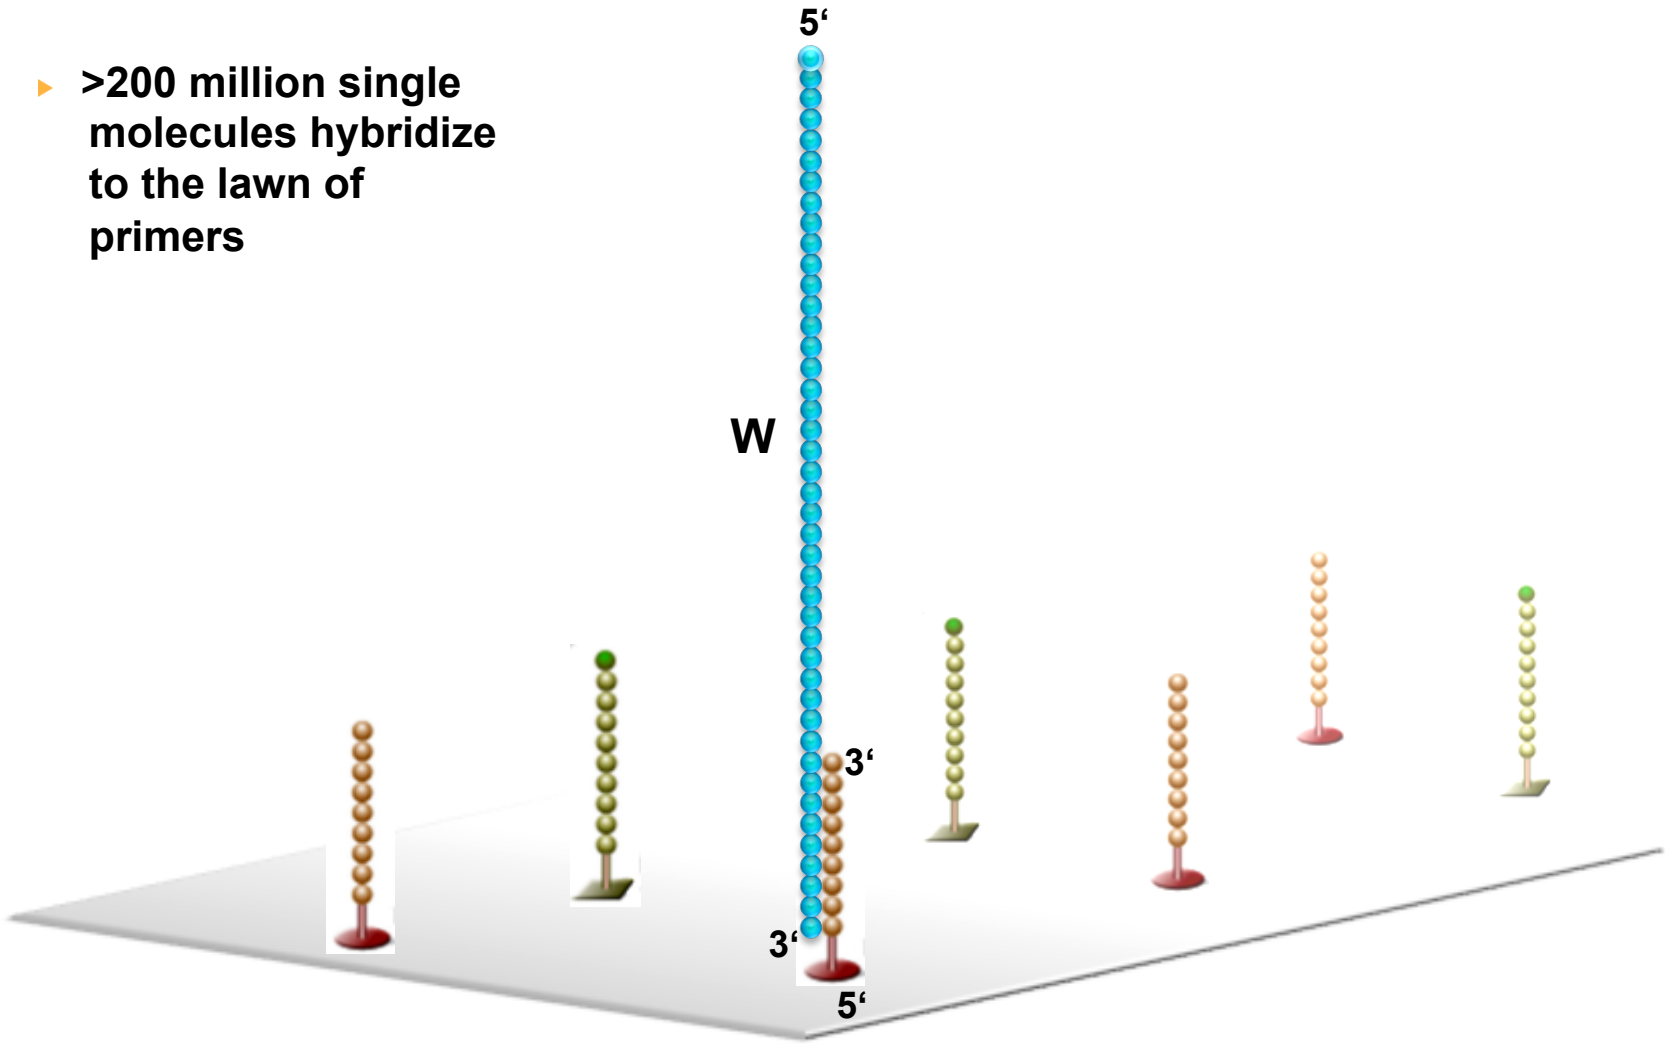
Illumina template prep: bridge PCR



Achtung:
Cleavage-Punkt des roten Primers liegt „weiter oben“ und lässt Großteil der roten Primerseq in der flowcell intakt.
Nach Seq-Runde1 kann man also erneut eine Bridge-PCR machen, dann den Strang grünen Strang durch Cleavage entfernen und den verbleibenden roten Strang mit dem grünen Primer sequenzieren
(= „paired end“-Sequenzierung; Runde 2)

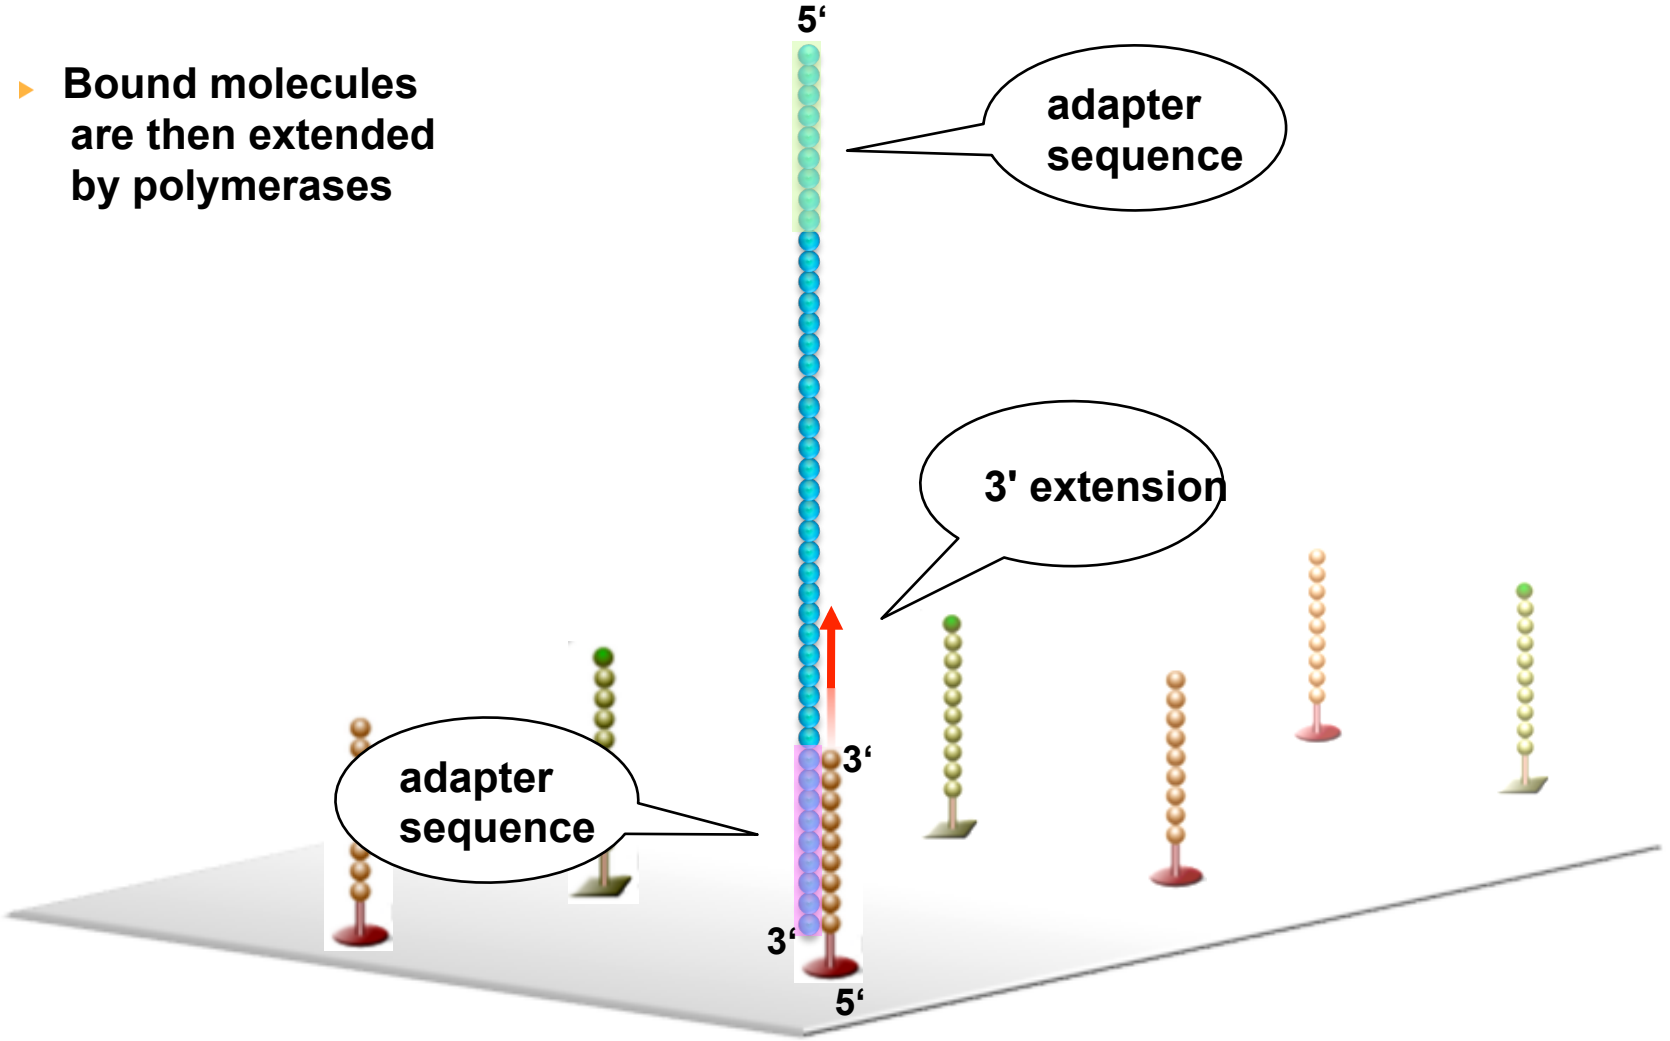
Illumina Cluster Generation

- >200 million single molecules hybridize to the lawn of primers



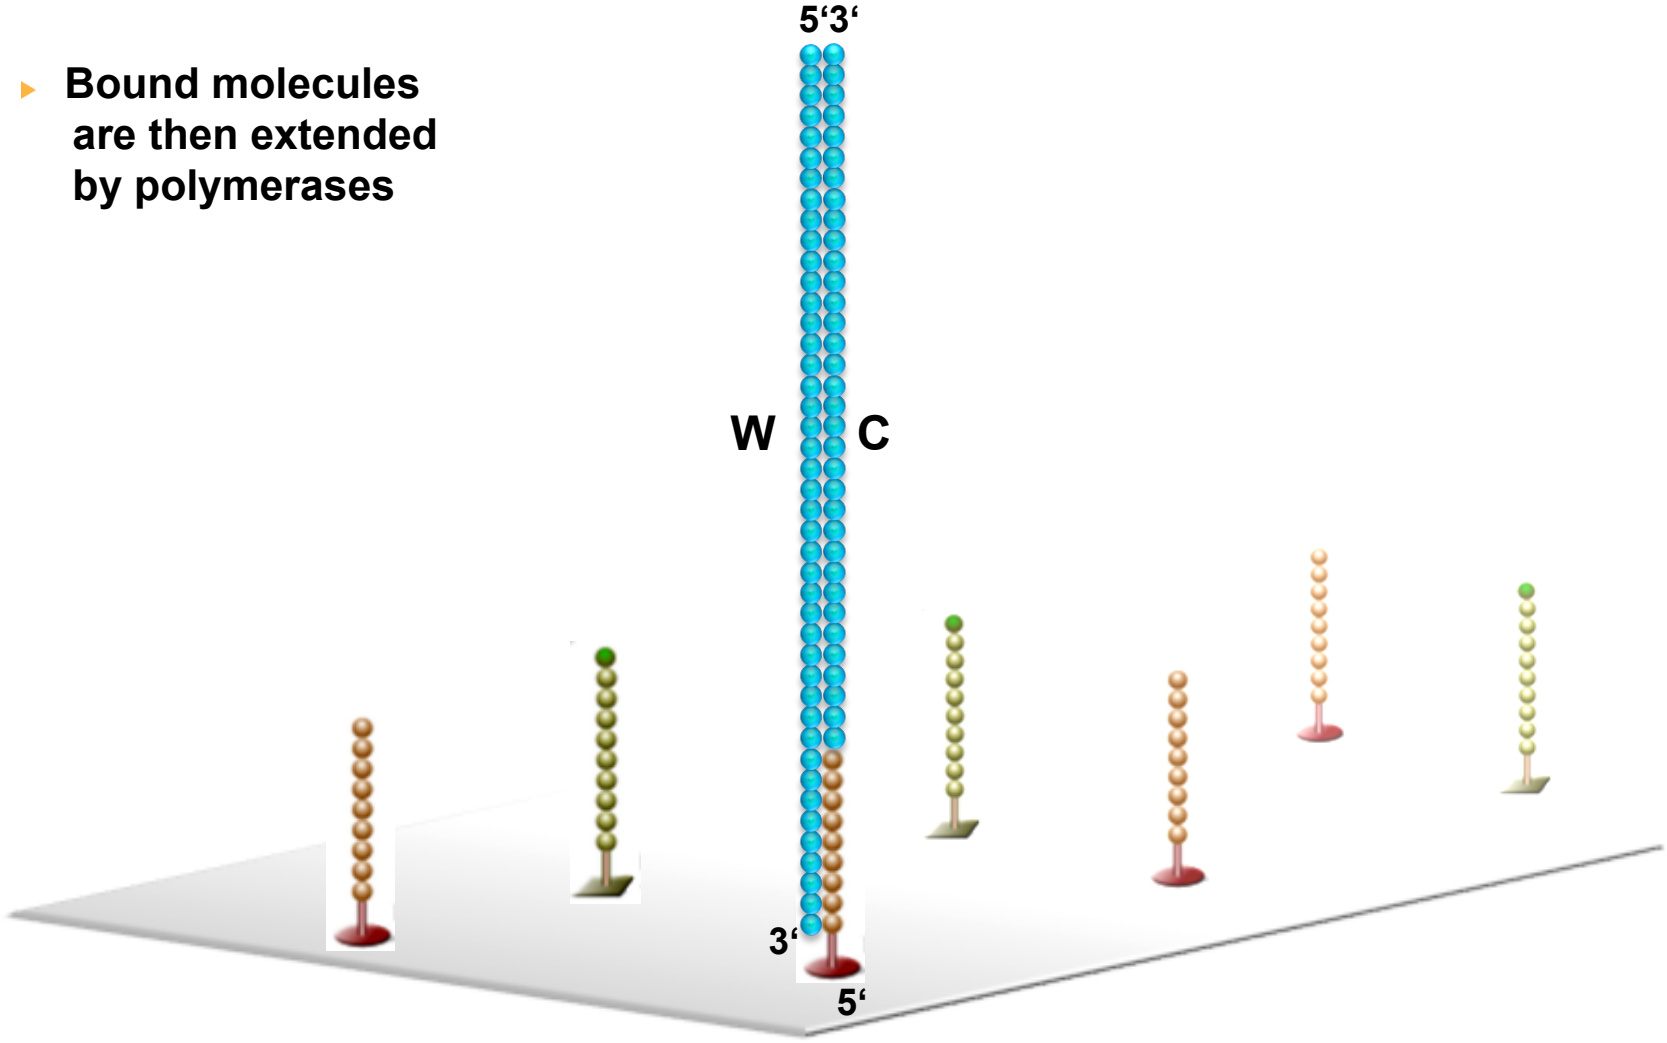
Illumina Cluster Generation

- Bound molecules are then extended by polymerases



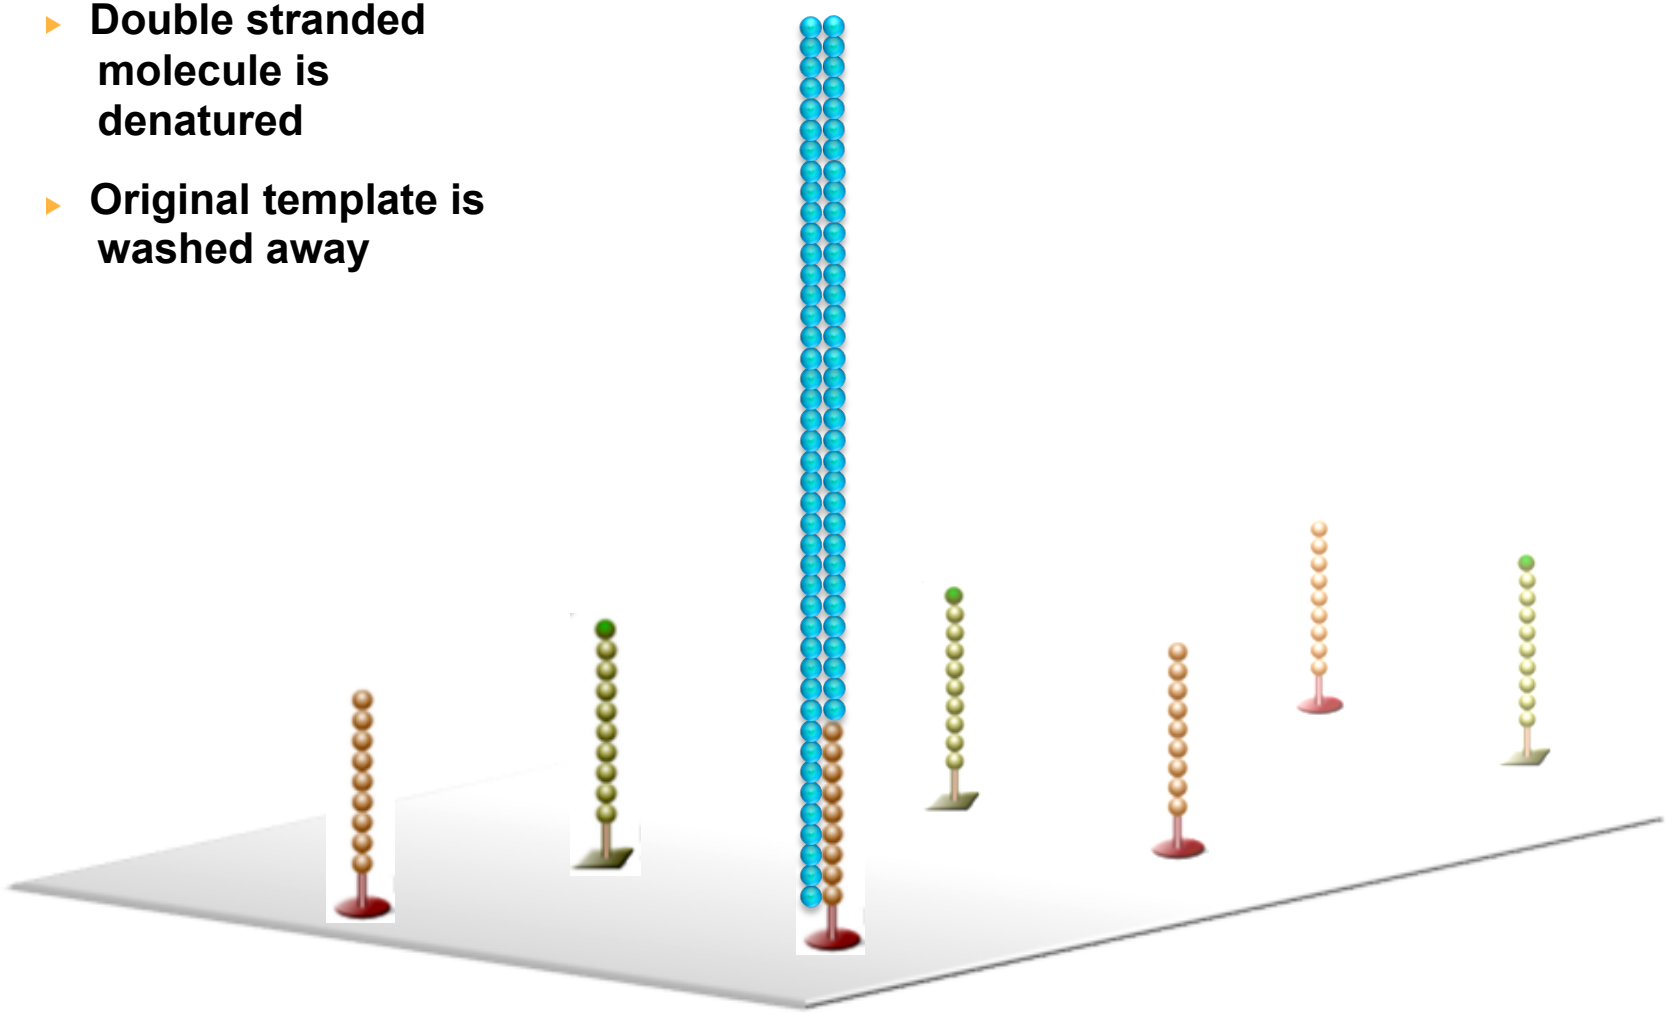
Illumina Cluster Generation

- Bound molecules are then extended by polymerases



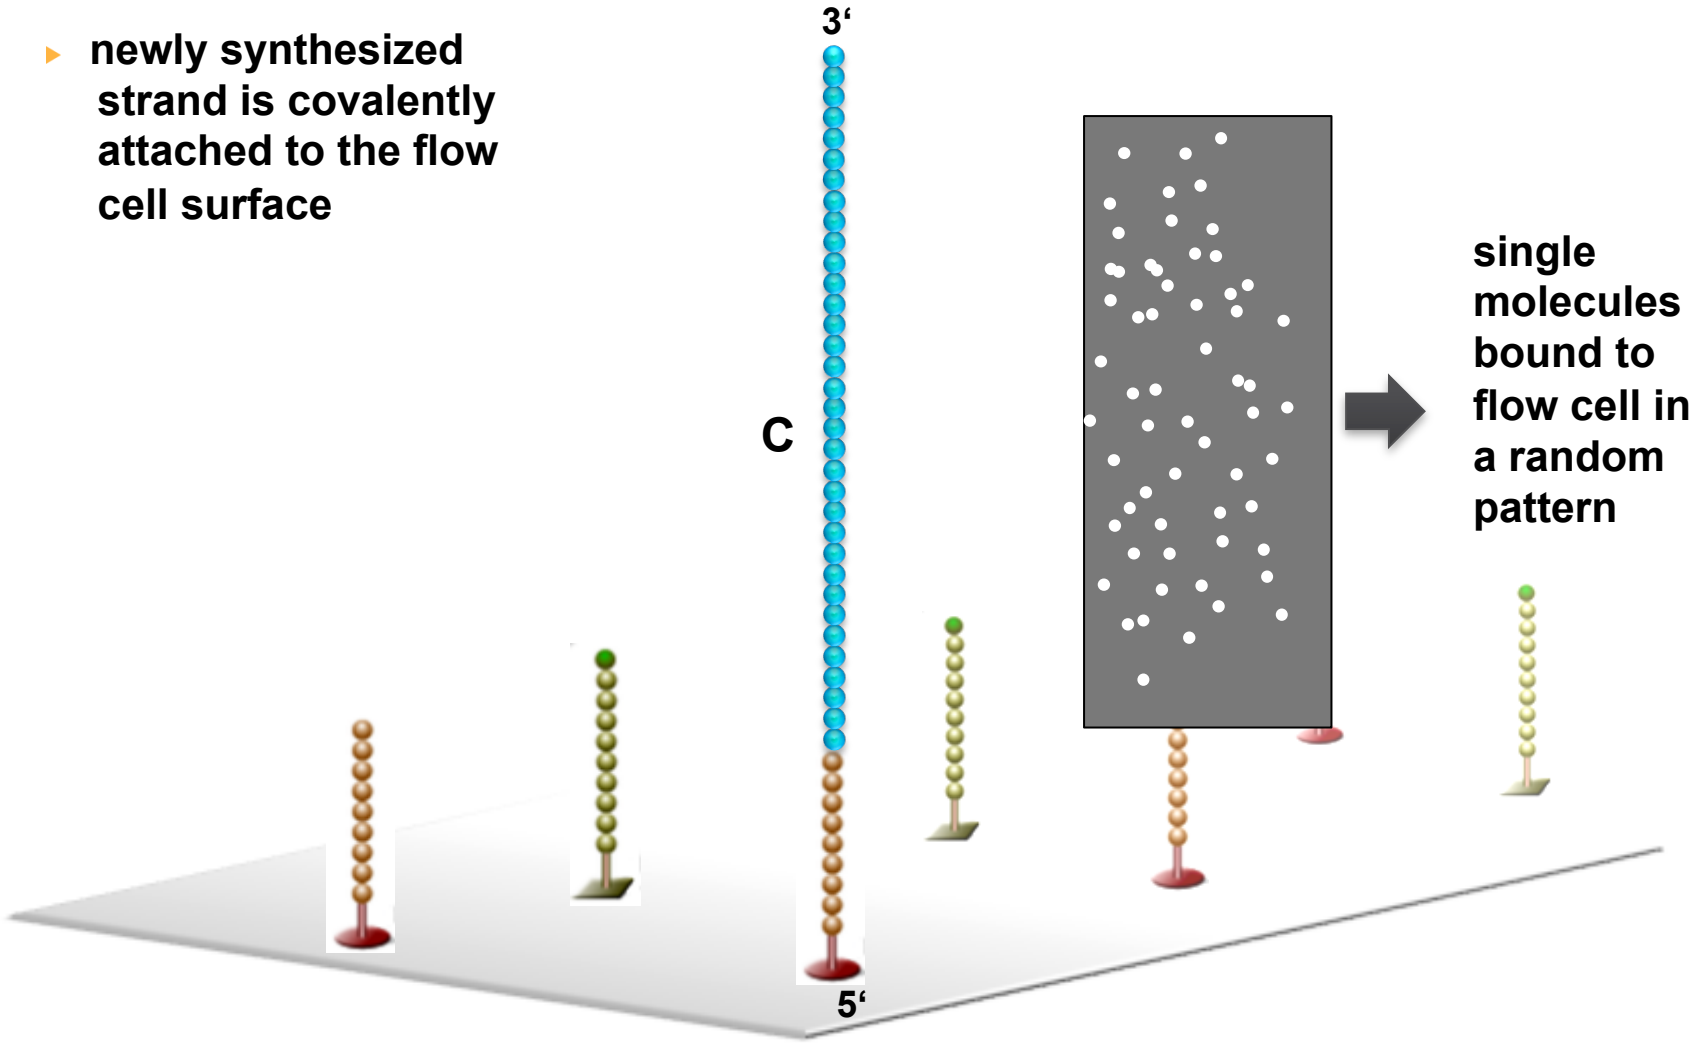
Illumina Cluster Generation

- Double stranded molecule is denatured
- Original template is washed away



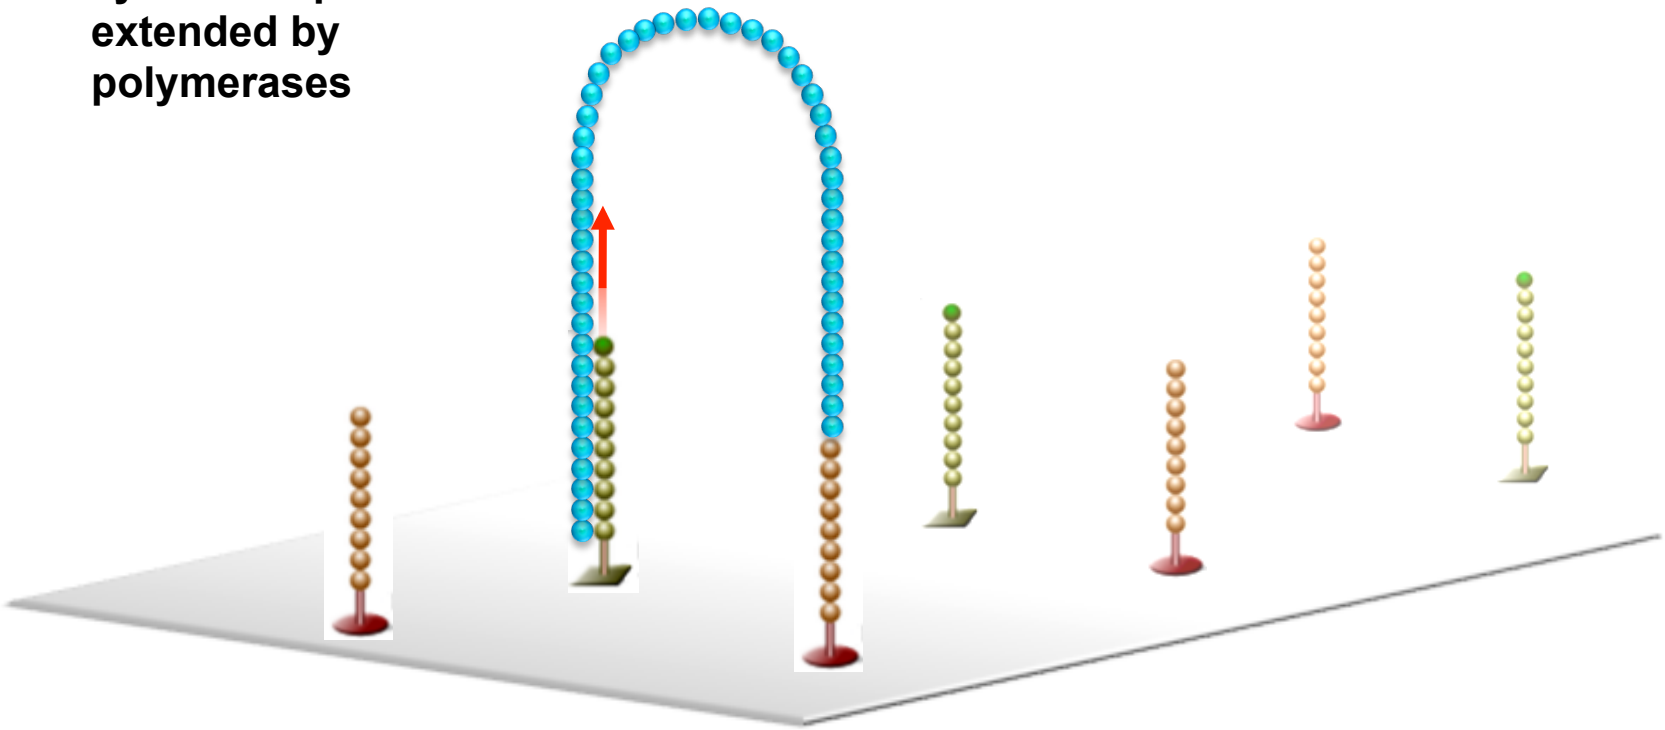
Illumina Cluster Generation

- newly synthesized strand is covalently attached to the flow cell surface



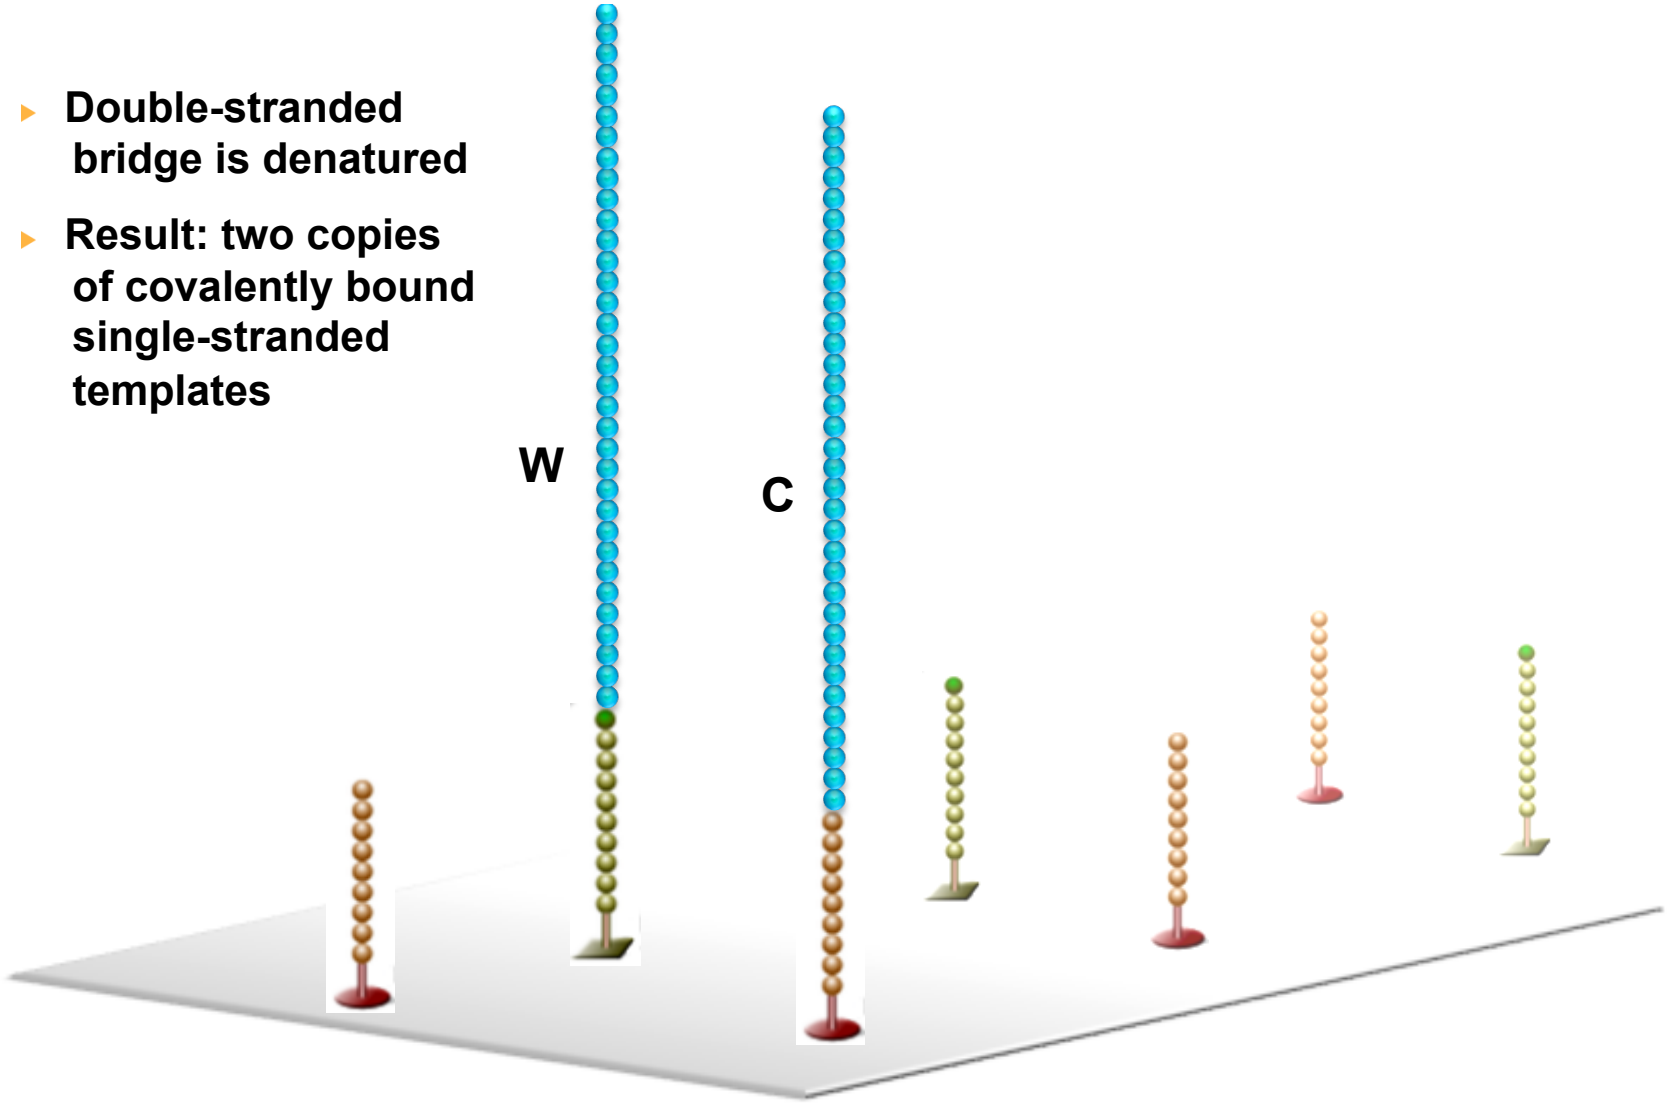
Illumina Cluster Generation

- Single-strand flips over to hybridize to adjacent oligos to form a bridge
- Hybridized primer is extended by polymerases



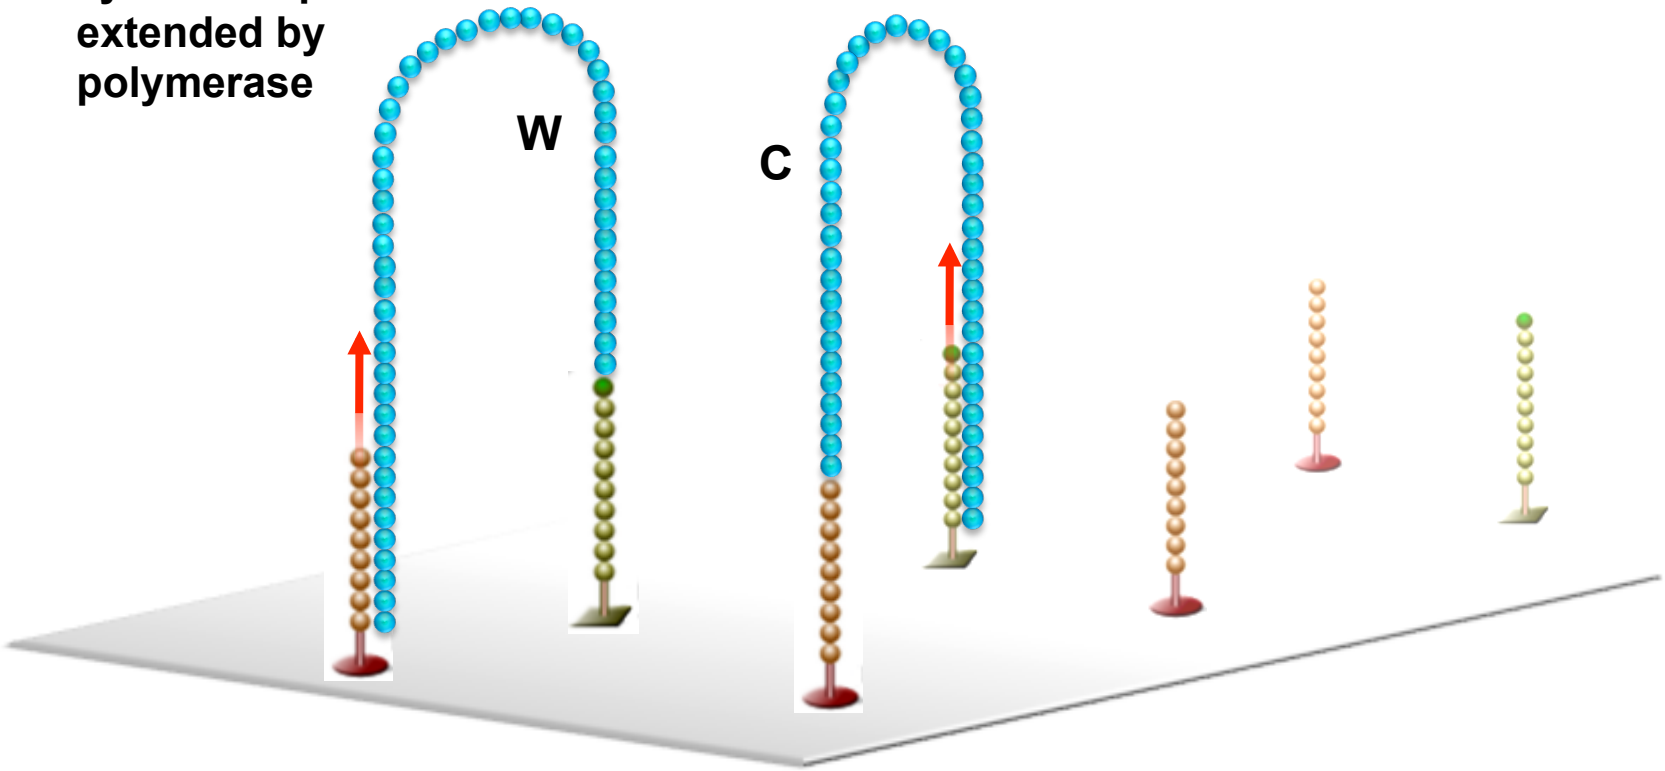
Illumina Cluster Generation

- Double-stranded bridge is denatured
- Result: two copies of covalently bound single-stranded templates



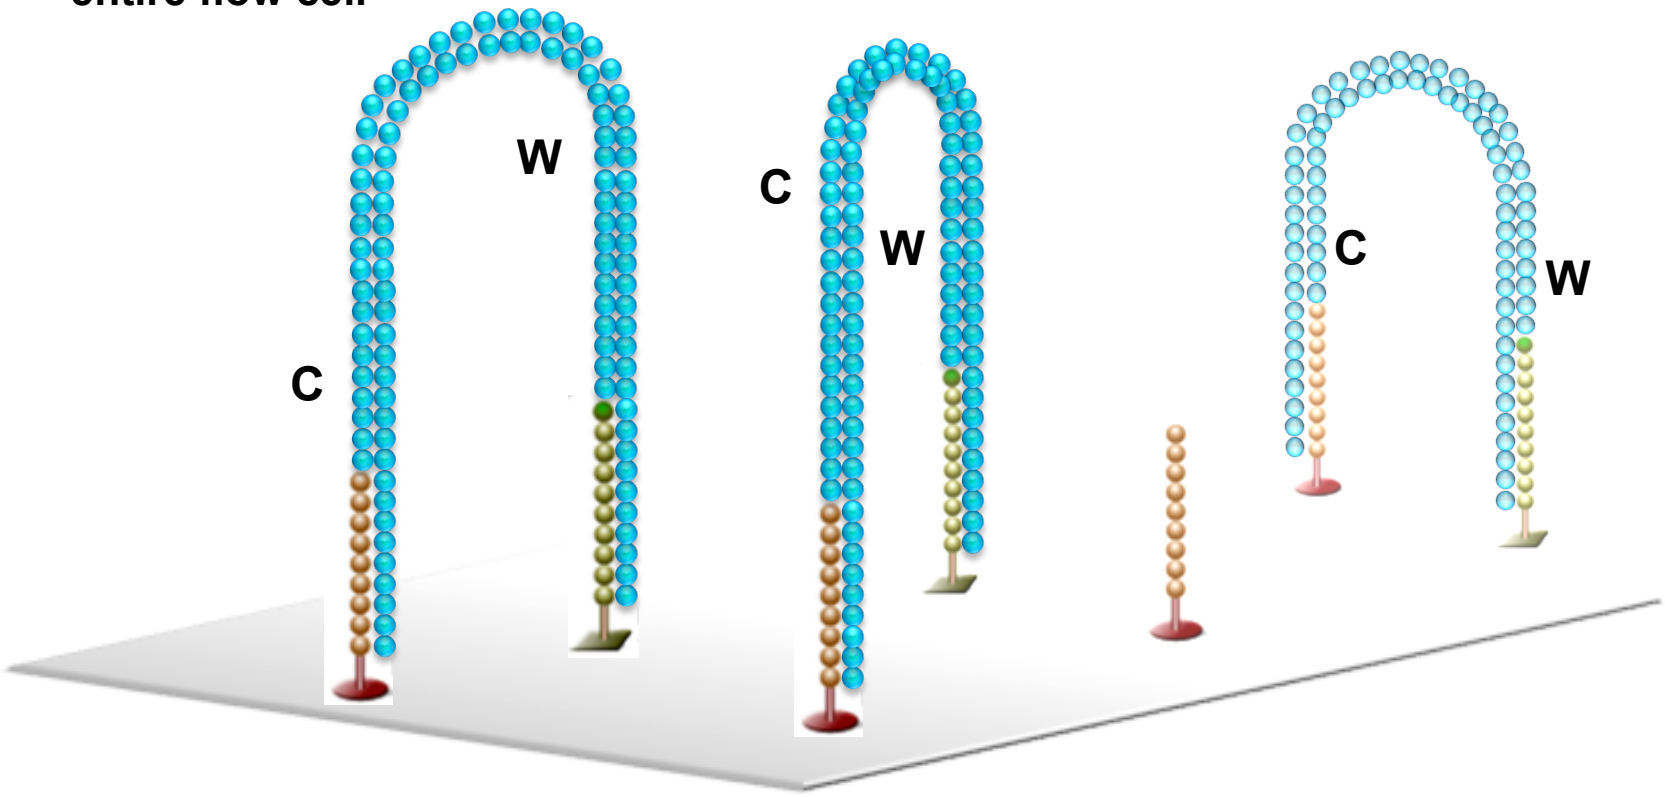
Illumina Cluster Generation

- Single-strands flip over to hybridize to adjacent oligos to form bridges
- Hybridized primer is extended by polymerase



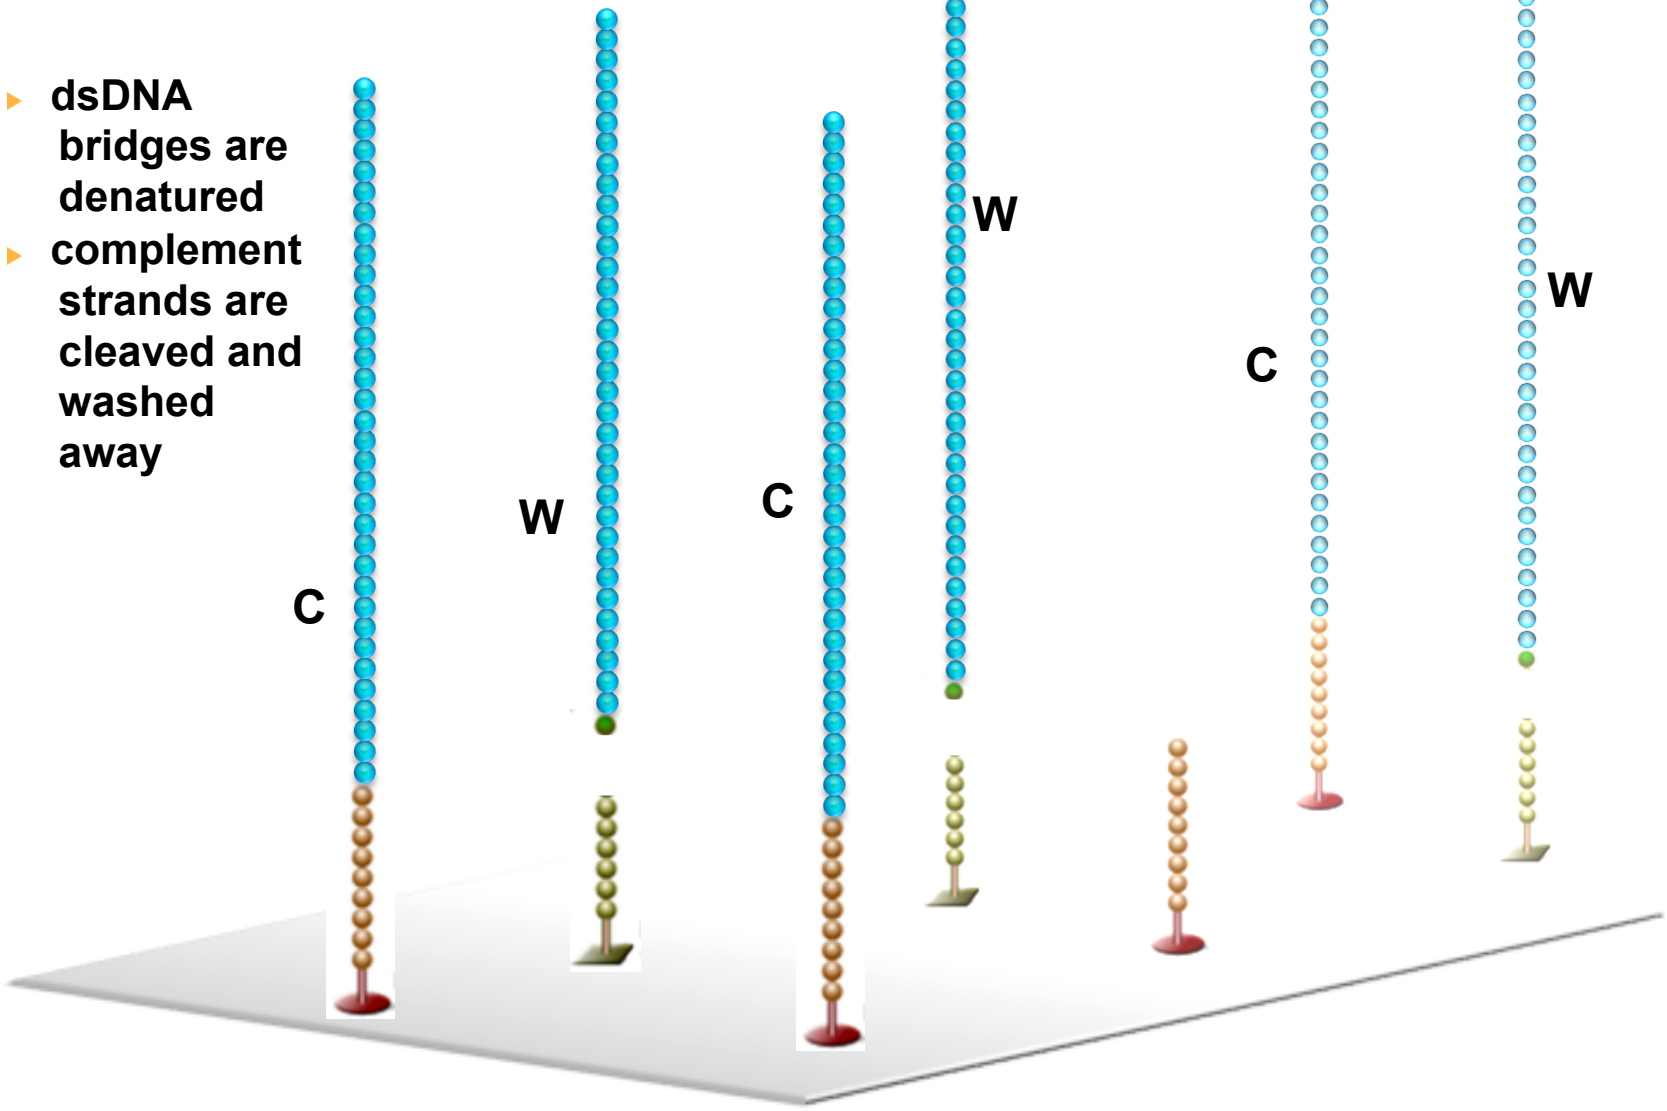
Illumina Cluster Generation

- **Bridge amplification cycle repeated until multiple bridges are formed across the entire flow cell**



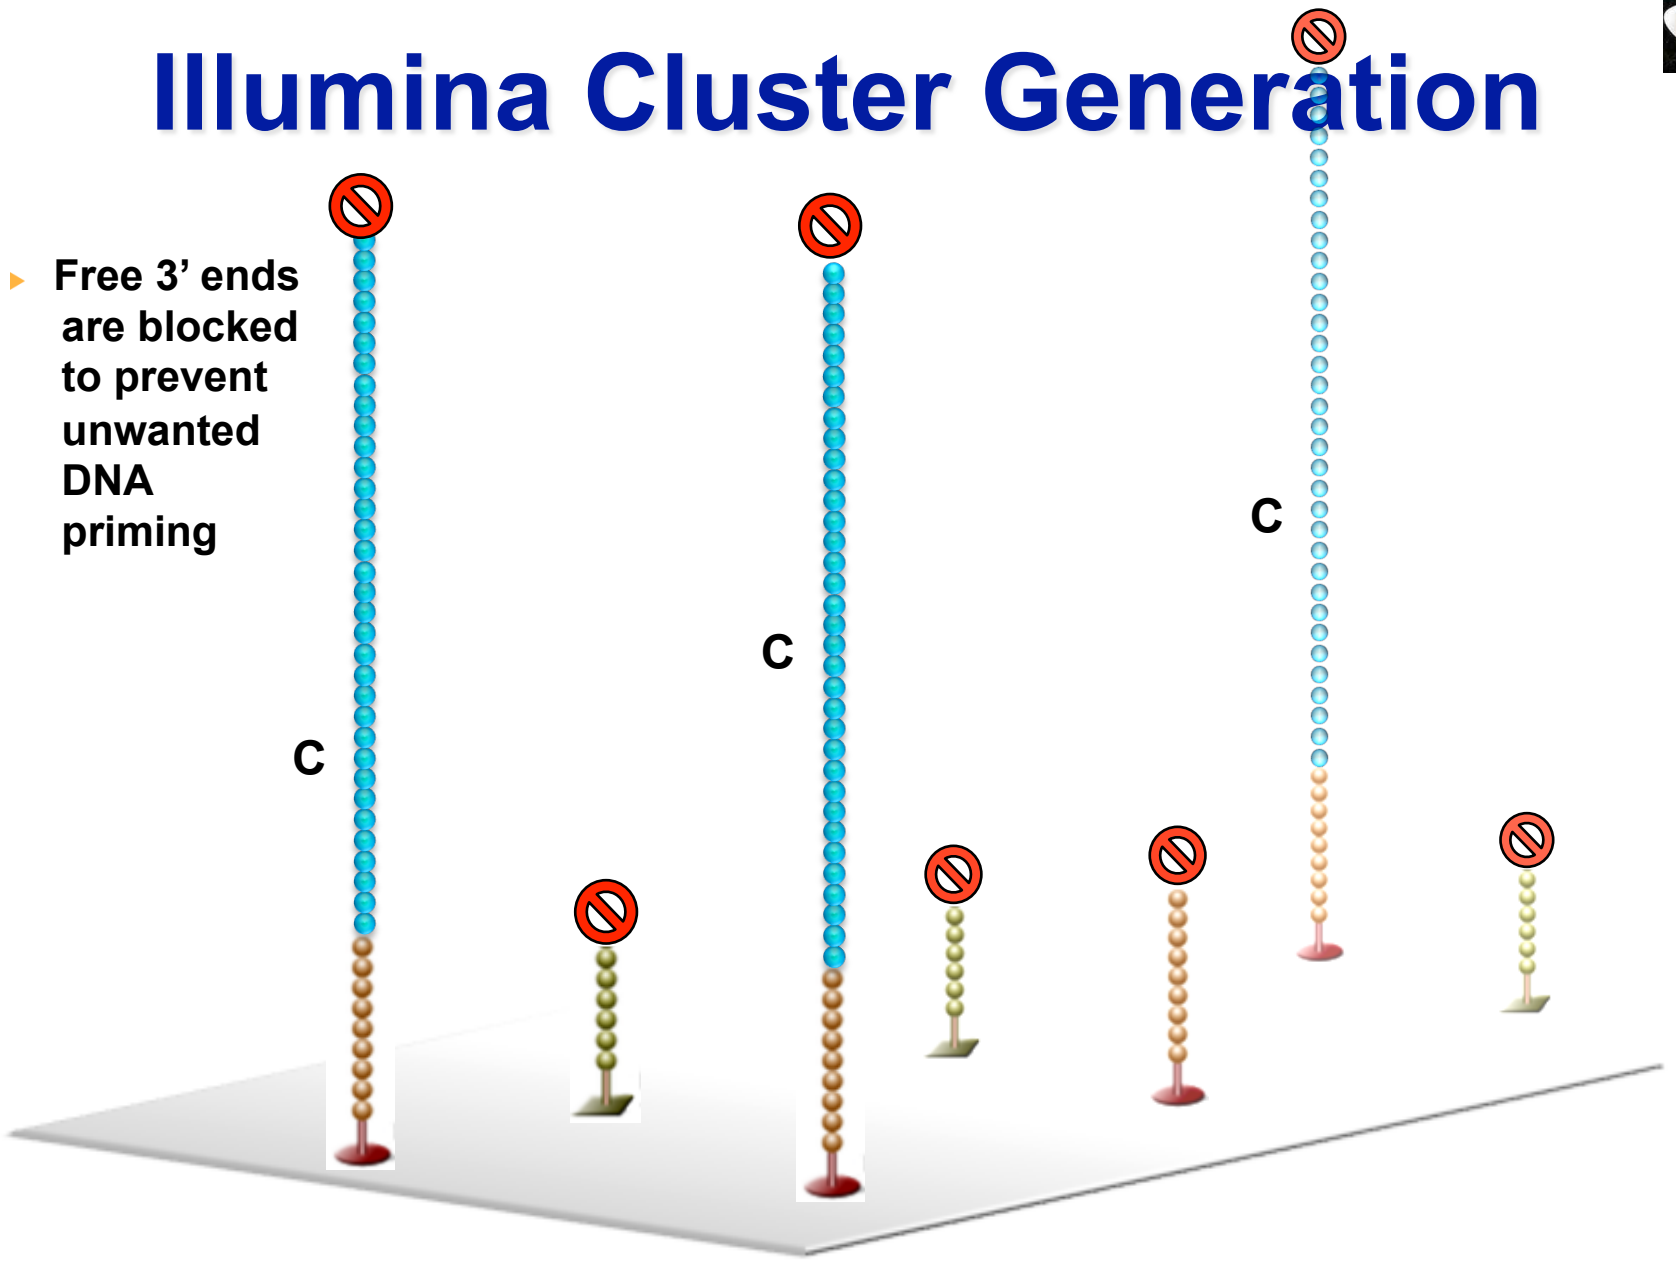
Illumina Cluster Generation

- dsDNA bridges are denatured
- complement strands are cleaved and washed away



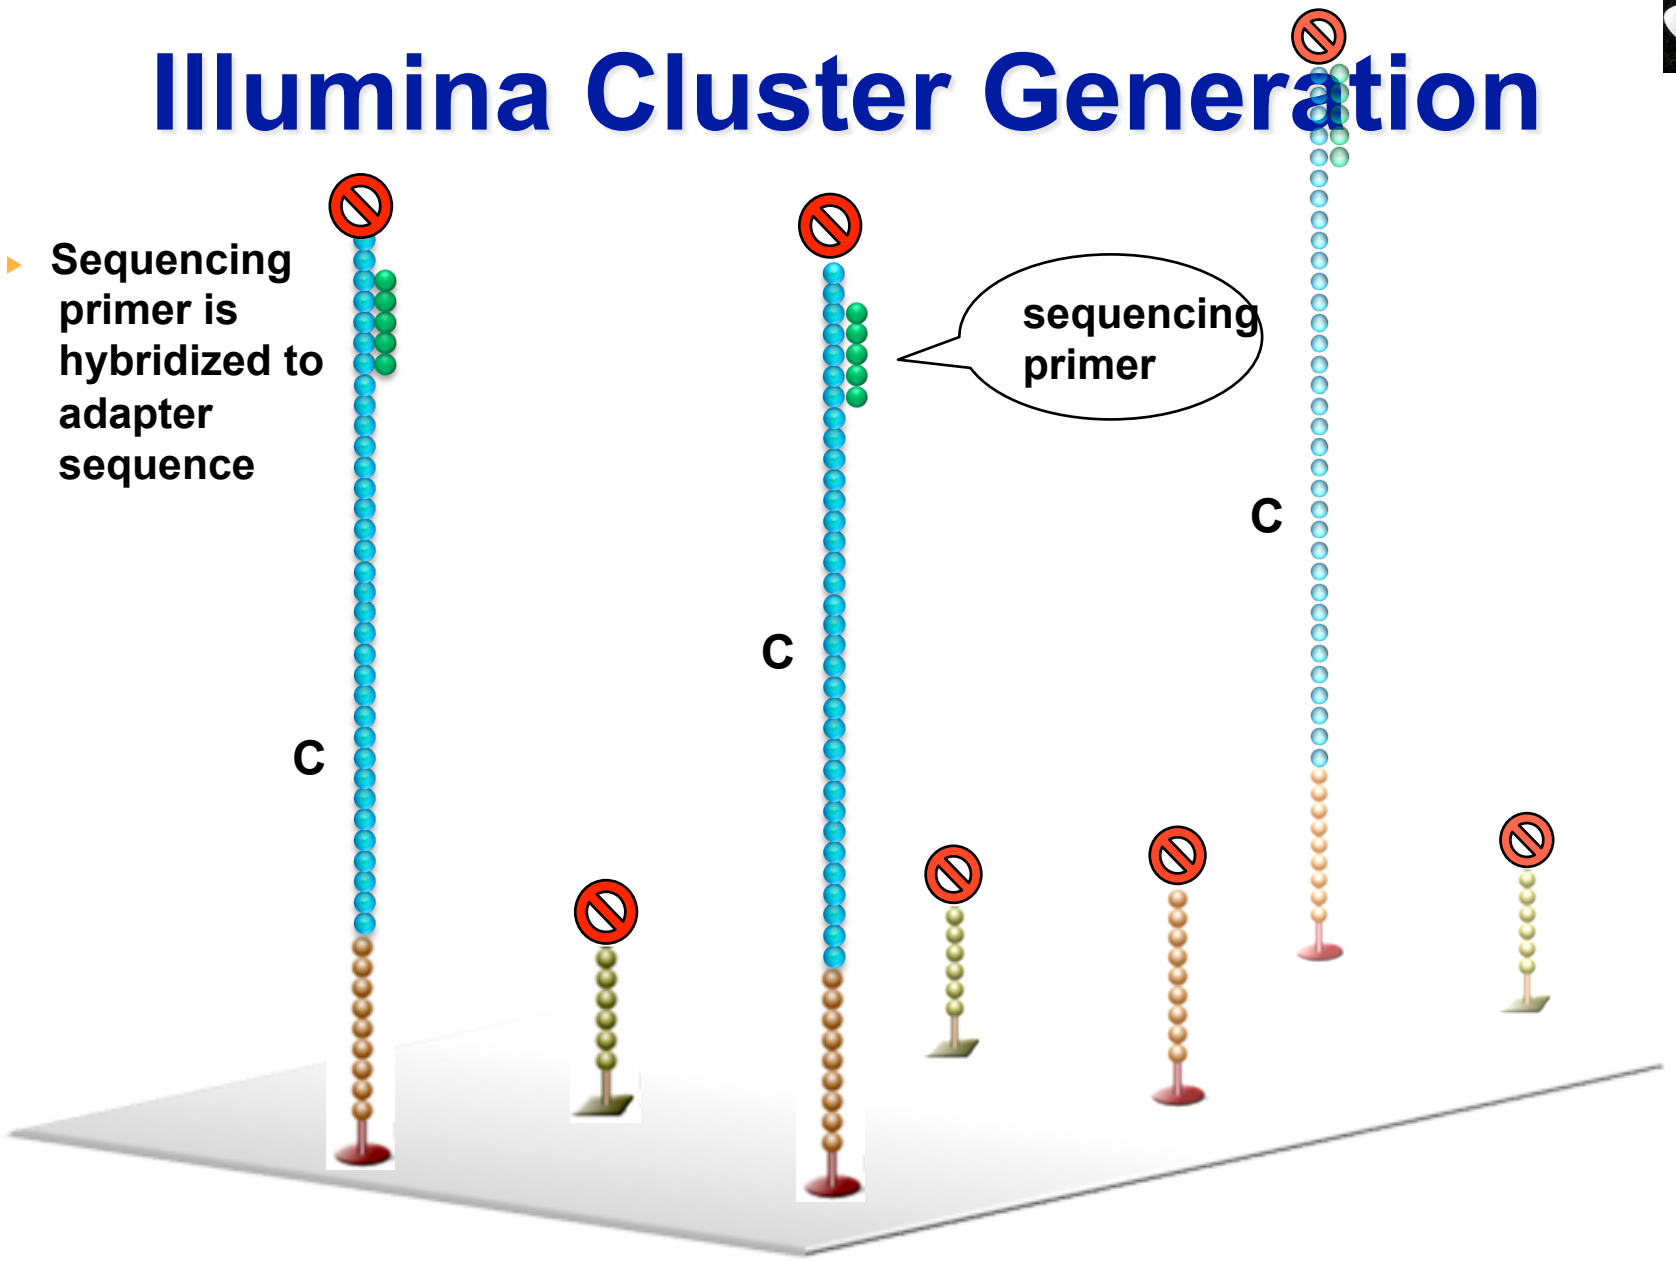
Illumina Cluster Generation

- Free 3’ ends are blocked to prevent unwanted DNA priming

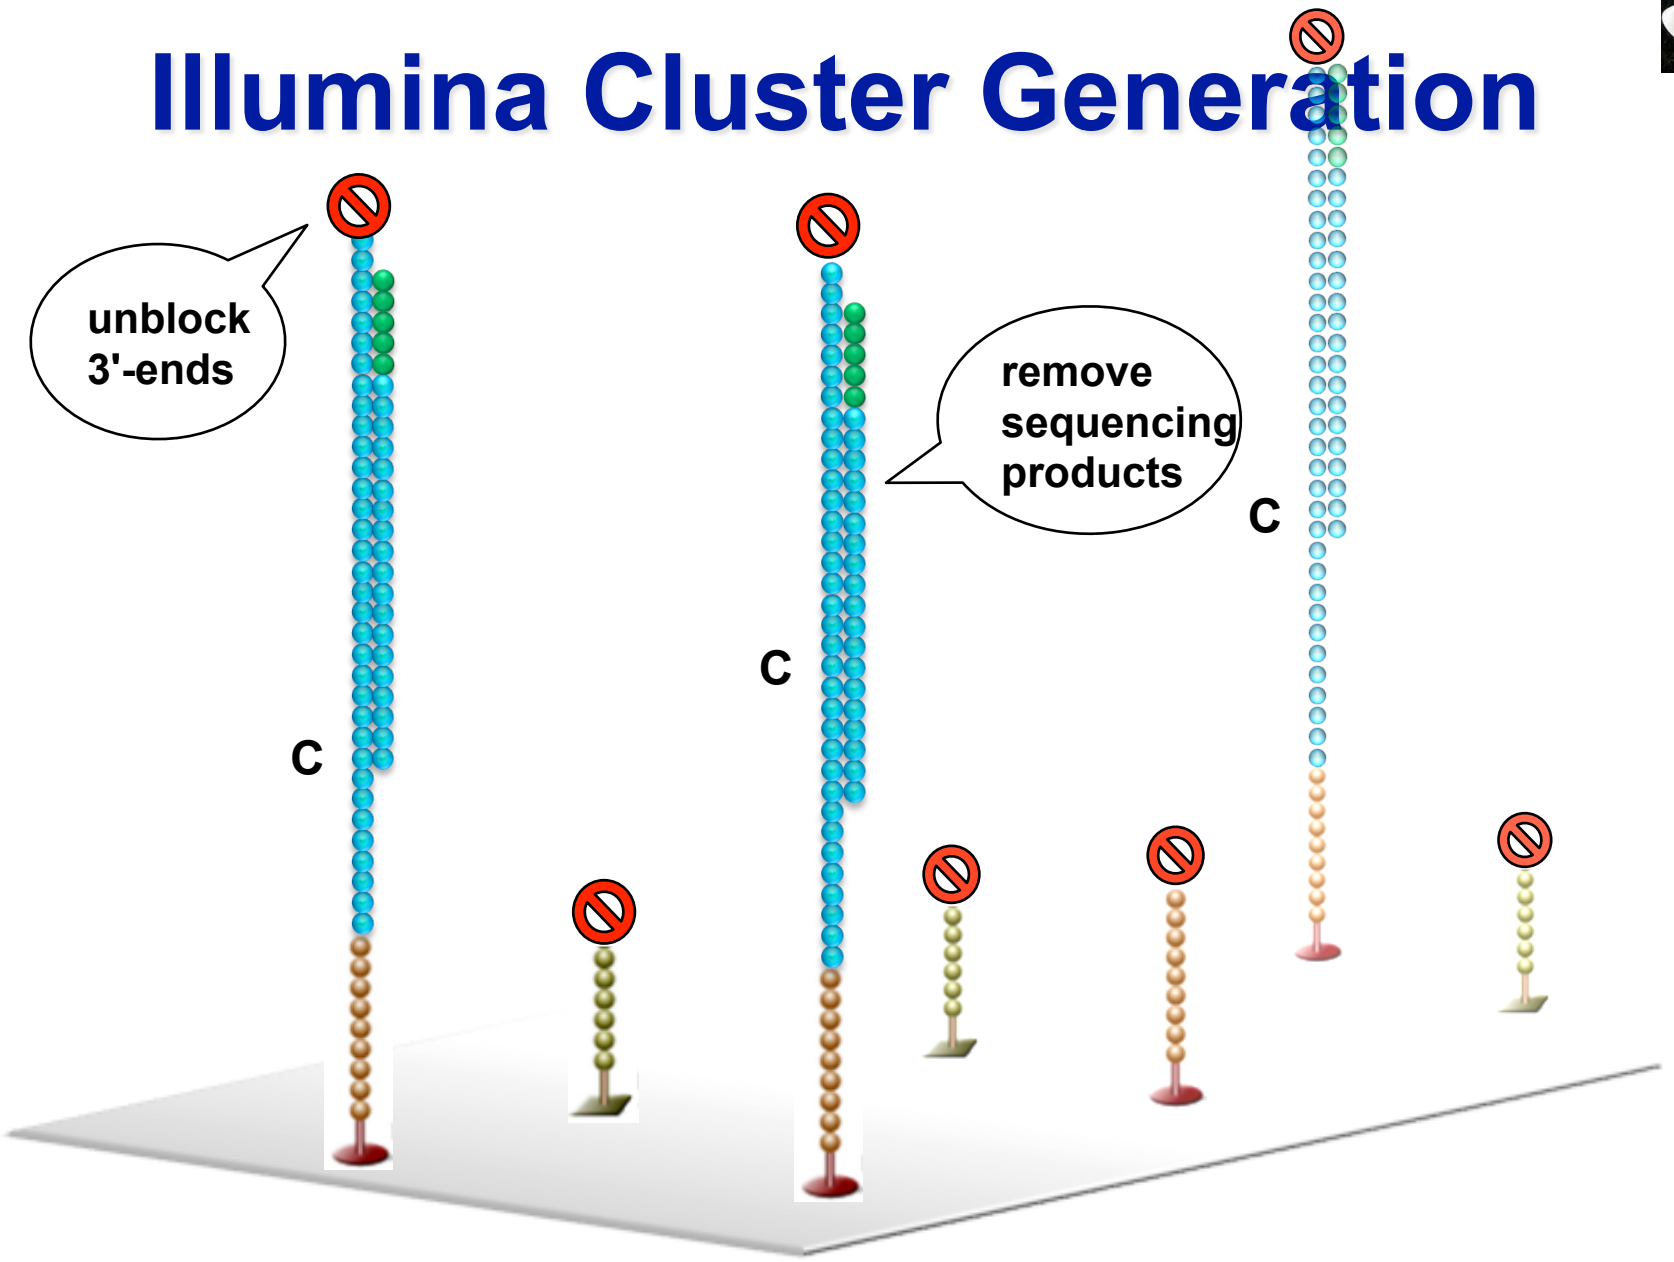


Illumina Cluster Generation

- Sequencing primer is hybridized to adapter sequence



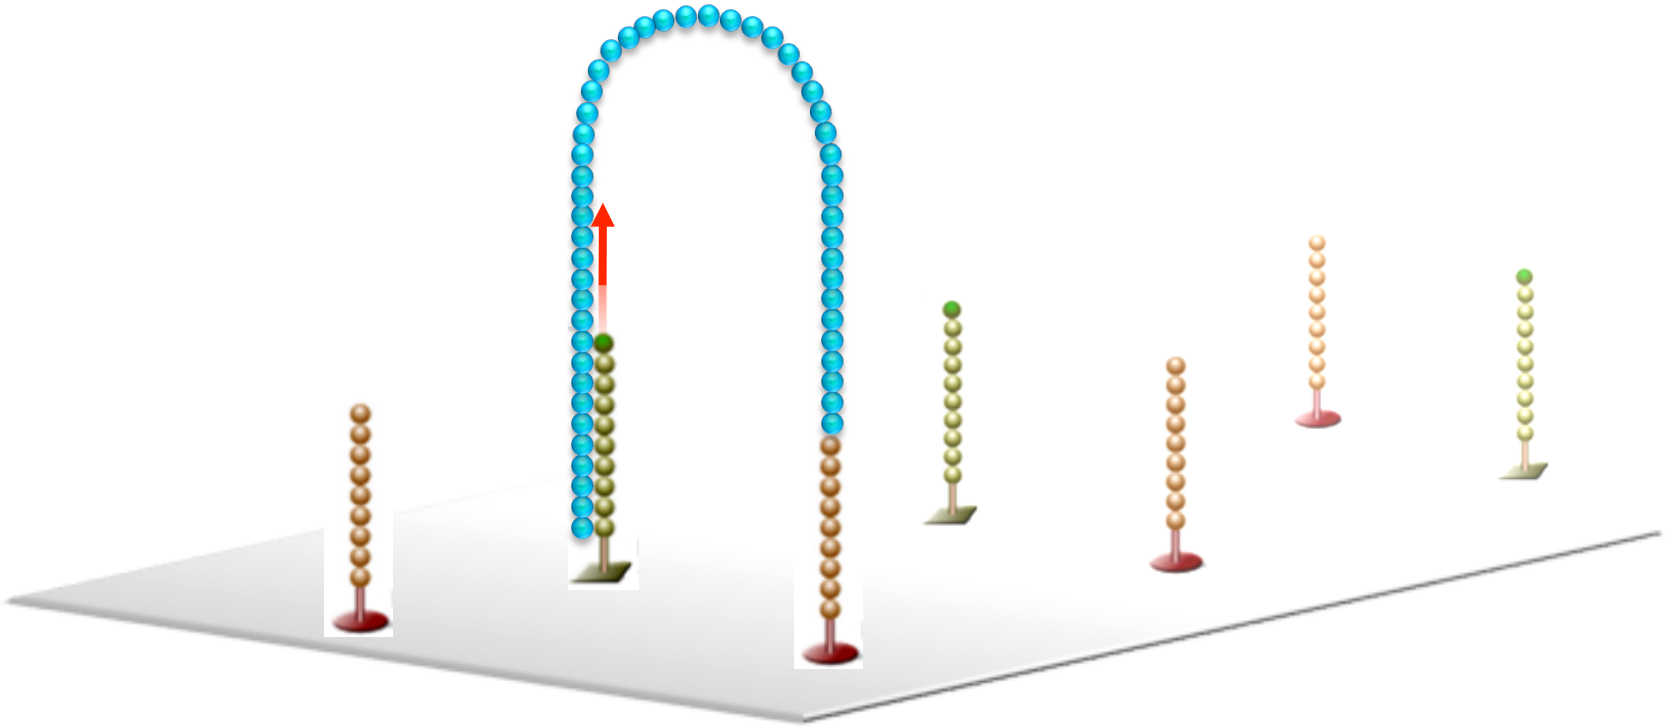
Illumina Cluster Generation



Sequence 2nd strand! (Paired-end sequencing) > W strand needed

Illumina Cluster Generation

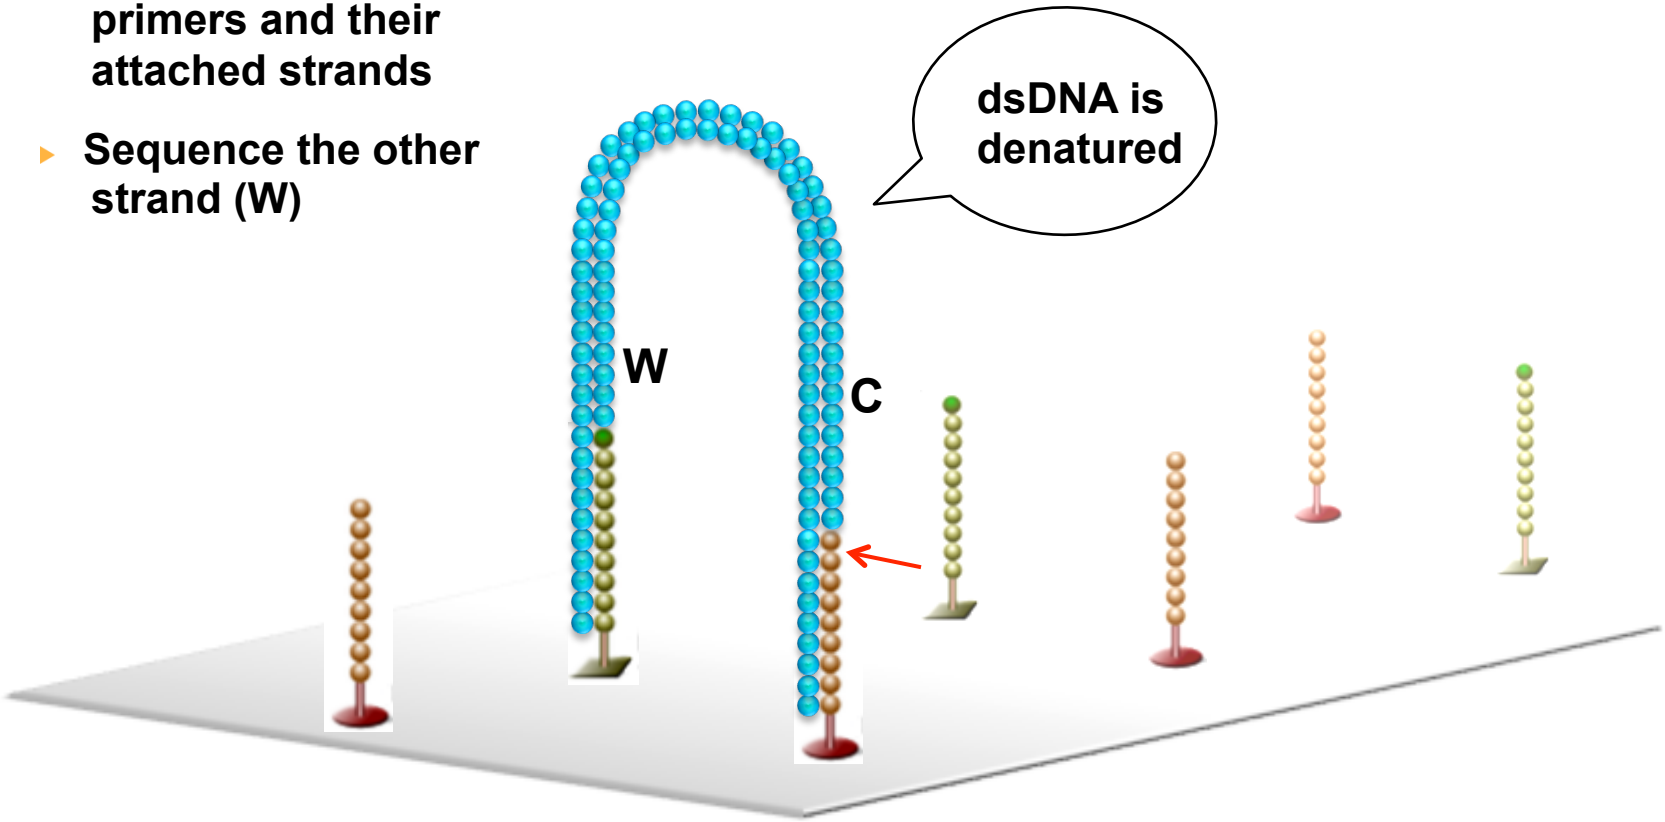
- **Bridge formation and 3' extension**



Do it again! New bridge PCR! Then remove C strand…

Illumina Cluster Generation

- Bridge PCR Round 2
- Cleave off red primers and their attached strands
- Sequence the other strand (W)



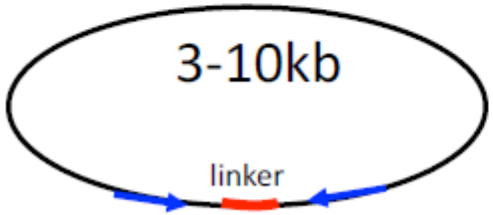
> Paired-end sequencing

Sequenzierstrategien

Illumina/SOLiD

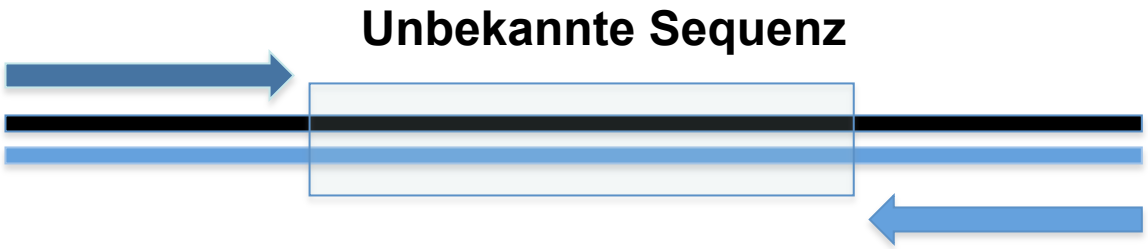
Single end (SE)

Paired-end (PE), short fragment ends



Mate-pair (MP), another type of paired-end, circularization (cloning)

Paired End Sequencing



„inward-facing reads“, Abstand gering und definiert

Zusätzlich brauchen wir „long-distance“-Sequenzinformation, um Contigs relativ zueinander anzuordnen...

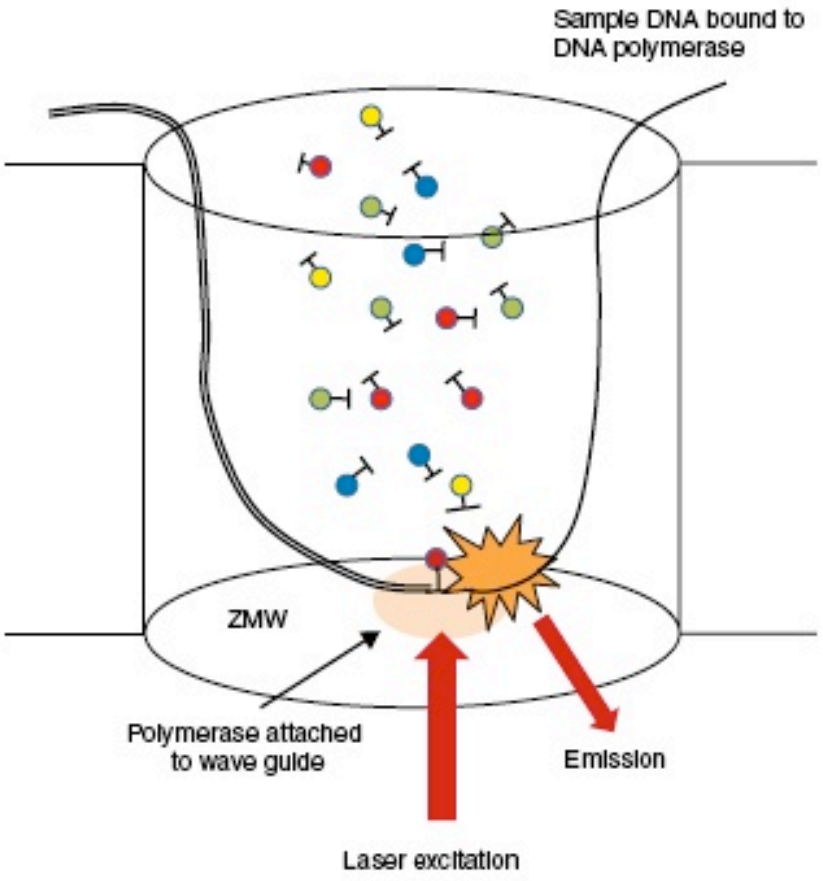
Pacific Biosystems:
single molecule long-range sequencing

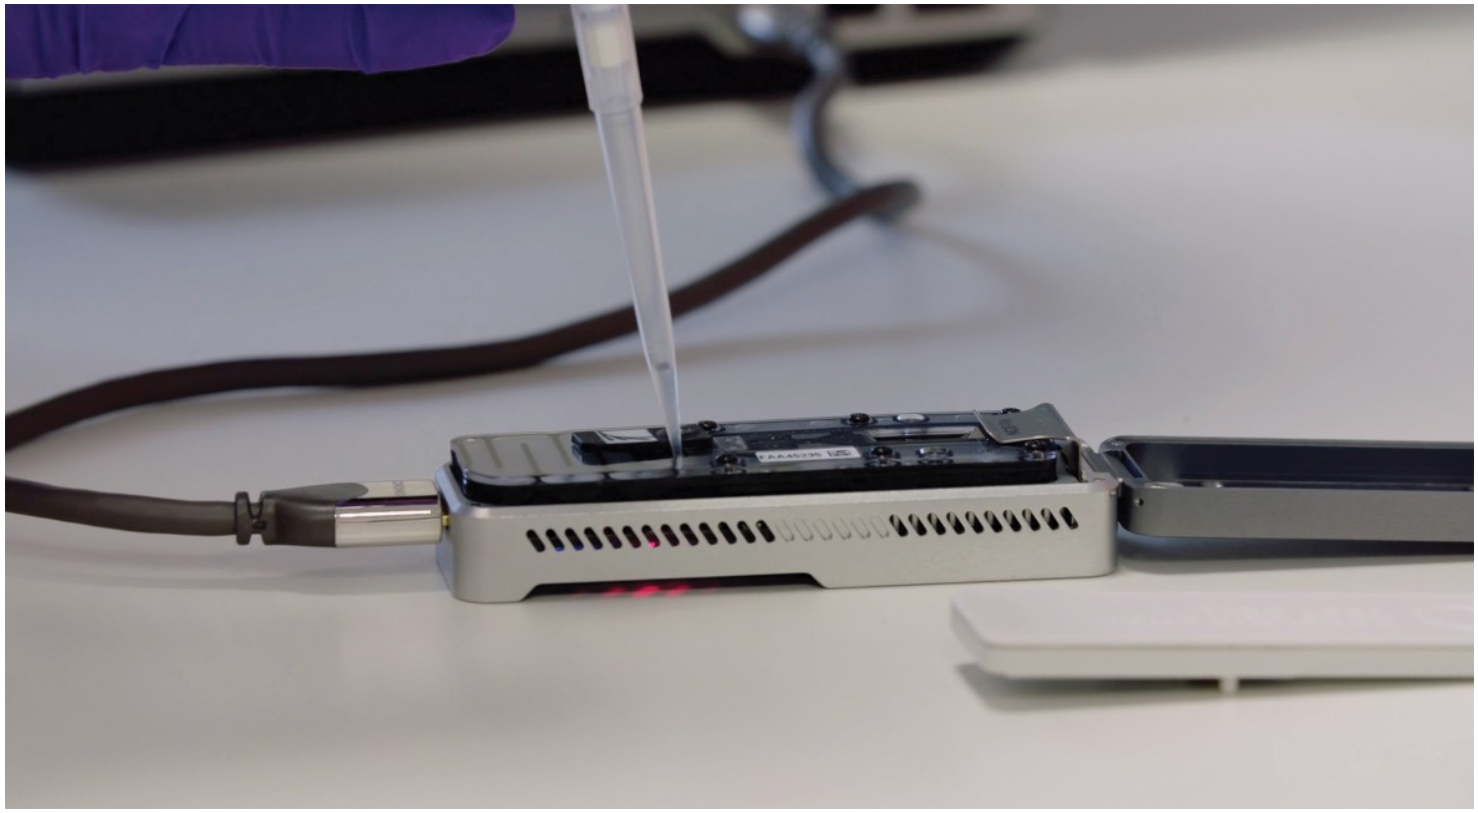


- **read length of > 5000 Bp !!**
- **long-range sequence information !!**

but

- **expensive machine**
- **low to medium throughput**
- **extreme error rate (up to 20%)**

Nanopore sequencing: towards single molecule detection



Oxford Nanopore „MinION“

Oxford Nanopore MinION

Pro

- Small (90g only)
- Cheap (1000 $)
- Very long reads (up to 1 MBp)
- Can be used anywhere!
- $1D^2$ Reads (old = 2D)
- direct RNA sequencing

Con

- Low throughput
- High error rate
- New algorithms needed
- Only about 12 % of the pores are atm active
